Abstract

The cryptocode package provides a set of macros to ease the type setting of pseudocode, algorithms and protocols (such as the one below). In addition it comes with a wide range of tools to type set cryptographic papers (hence the name). This includes simple predefined commands for type setting probabilities and "commonly encountered math" as well as for concepts such as a security parameter 1^n or advantage terms $\mathsf{Adv}^{\mathsf{prf}}_{A,\mathsf{PRF}}(n) = \mathsf{negl}(n).$ Furthermore, it includes environments to layout game-based proofs or black-box reductions.

Alice		Bob
$x \leftarrow \mathbb{Z}_q$		
$X \leftarrow g^x$	\mathbb{G},q,g,X	
		$y \leftarrow \mathbb{Z}_q$
	Y	$y \leftarrow \$ \mathbb{Z}_q$ $Y \leftarrow g^y$
		
$k_A \leftarrow Y^x$		$\mathbf{k}_B \leftarrow X^y$

^{*}If you use cryptocode in your work, consider starring the repository on GitHub and/or rating it on CTAN.

1 Cryptocode by Example

The cryptocode package provides a set of commands to ease the typesetting of pseudocode, protocols, game-based proofs and black-box reductions. In addition it comes with a large number of predefined commands. In this section we present the various features of cryptocode by giving small examples. But first, let's load the package

```
\usepackage[
     n, % or lambda
     advantage,
     operators,
     sets,
     adversary,
     landau,
     probability,
     notions,
     logic,
11
     ff,
12
     mm,
13
     primitives,
14
     events,
15
     complexity,
16
     oracles
17
     asymptotics,
     keys
18
   ]{cryptocode}
19
```

Note that all the options refer to a set of commands. That is, without any options cryptocode will provide the mechanisms for writing pseudocode, protocols, game-based proofs and black-box reductions but not define additional commands, such as \pk or \sk (for typesetting public and private/secret keys) which are part of the keys option. We discuss the various options and associated commands in Section 2.

1.1 Pseudocode

The cryptocode package tries to make writing pseudocode easy and enjoyable. The \pseudocode command takes a single parameter where you can start writing code in mathmode using \\ as line breaks. Following is an IND-CPA game definition using various commands from cryptocode to ease writing keys (\pk,\sk), sampling (\sample), and more:

In many cases, we want to set pseudocode blocks in-between paragraphs with spacing similar to how we would offset equations. For this, and for laying out multiple code blocks, cryptocode offers "stacking" environments \pchstack and \pcvstack. For typesetting a code block nicely centered and boxed

```
\begin{array}{lll} 1: & b \leftarrow \$ \left\{ 0,1 \right\} \\ 2: & (\mathsf{pk},\mathsf{sk}) \leftarrow \$ \, \mathsf{KGen}(1^n) \\ 3: & (\mathsf{state},m_0,m_1) \leftarrow \$ \, \mathcal{A}(1^n,\mathsf{pk},c) \\ 4: & c \leftarrow \$ \, \mathsf{Enc}(\mathsf{pk},m_b) \\ 5: & b' \leftarrow \$ \, \mathcal{A}(1^n,\mathsf{pk},c,\mathsf{state}) \\ 6: & \mathbf{return} \, \, b = b' \end{array}
```

you could thus use:

```
begin{pchstack}[center,boxed]

pseudocode[linenumbering]{

b \sample \bin \\
(\pk,\sk) \sample \kgen (\secparam) \\
(\state,m_0,m_1) \sample \adv(\secparam, \pk, c) \\
c \sample \enc(\pk,m_b) \\
b' \sample \adv(\secparam, \pk, c, \state) \\
pcreturn b = b' }

end{pchstack}
```

As this is a common task, cryptocode offers the \pseudocodeblock command which is a shorthand for the above (without the frame). In case you want to provide different options or a shorter command (say \pcb) you can easily define the command via

```
\label{lock} $$ \operatorname{center}, \operatorname{boxed}_{\{\}}_{\{\}}$$
```

The above could now be written, more succinctly as

```
pcb[linenumbering]{
    b \sample \bin \\
    (\pk,\sk) \sample \kgen (\secparam) \\
    (\state,m_0,m_1) \sample \adv(\secparam, \pk, c) \\
    c \sample \enc(\pk,m_b) \\
    b' \sample \adv(\secparam, \pk, c, \state) \\
    pcreturn b = b'
}
```

The pseudocode command (and its block variant) takes a single mandatory argument (the code) plus an optional argument which allows you to specify options in a key=value fashion. In the above example we used the linenumbering option.

It is easy to define a heading for your code. Either specify the header using the option "head" or use the \procedure command (or its block variant \procedureblock) which takes an additional argument to specify the headline.

```
IND-CPA_{\mathsf{Enc}}^{\mathcal{A}}(n)

1: b \leftarrow \$ \{0,1\}

2: (\mathsf{pk}, \mathsf{sk}) \leftarrow \$ \mathsf{KGen}(1^n)

3: (\mathsf{state}, m_0, m_1) \leftarrow \$ \mathcal{A}(1^n, \mathsf{pk}, c)

4: c \leftarrow \$ \mathsf{Enc}(\mathsf{pk}, m_b)

5: b' \leftarrow \$ \mathcal{A}(1^n, \mathsf{pk}, c, \mathsf{state})

6: \mathsf{return} \ b = b'
```

```
1  \procedureblock[linenumbering]{$\indcpa_\enc^\adv(\secpar)$}{
2    b \sample \bin \\
3    (\pk,\sk) \sample \kgen (\secparam) \\
4    (\state,m_0,m_1) \sample \adv(\secparam, \pk, c) \\
5    c \sample \enc(\pk,m_b) \\
6    b' \sample \adv(\secparam, \pk, c, \state) \\
7    \pcreturn b = b' }
```

Similarly to before, we can define a shorthand and boxed variant as

```
1 \createprocedureblock{procb}{center, boxed}{}}
```

There is a lot more that we will discuss in detail in Section 3. Here, for example, is the same code with an overlay explanation and a division of the pseudocode.

```
IND-CPA_{\mathsf{Enc}}^{\mathcal{A}}(n)

1: b \leftarrow \$ \{0,1\}

2: (\mathsf{pk},\mathsf{sk}) \leftarrow \$ \mathsf{KGen}(1^n)

... Setup Completed ...

3: (m_0,m_1) \leftarrow \$ \mathcal{A}(1^n,\mathsf{pk},c)

4: c \leftarrow \$ \mathsf{Enc}(\mathsf{pk},m_b)

5: b' \leftarrow \$ \mathcal{A}(1^n,\mathsf{pk},c,\mathsf{state})

6: \mathsf{return} \ b = b'
```

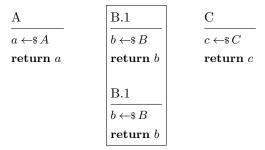

```
begin{pcimage}
procedureblock[linenumbering]{$\indcpa_\enc^\adv(\secpar)$}{%}
b \sample \bin \\
(\pk,\sk) \sample \kgen(\secparam)\pcnode{kgen} \pclb
pcintertext[dotted]{Setup Completed}
(m_0,m_1) \sample \adv(\secparam, \pk, c) \\
c \sample \enc(\pk,m_b) \\
b' \sample \adv(\secparam, \pk, c, \state) \\
pcreturn b = b' }

\pcdraw{
\node[rectangle callout, callout absolute pointer=(kgen), fill=orange]
at ([shift={(+3,-1)}]kgen) {
\begin{varwidth}{3cm}
$\kgen(\secparam)$ samples a public key $\pk$ and a private key $\sk$.
\end{varwidth}
};

\end{pcimage}
\end{pcimage}
```

1.2 Stacking

To arrange multiple procedures, cryptocode offers horizontal and vertical stacking environments \pchstack and \pcvstack. In the example below we arrange four code blocks in three columns equispaced with 1cm distance and stack two procedures in the center column.

```
\begin{pchstack} [center, space=1cm] \end{pchstack}
       \procedure {A} {
          a \sample A
         \pcreturn a
 \frac{4}{5} \frac{6}{7}
      \begin { pcvstack } [boxed, space=0.5cm]
         \procedure {B.1} {
 9
         b \sample B \\
10
         \pcreturn b
11
         √procedure{B.1}{
           \sample B \\
13
14
         \pcreturn b
15
16
      \end{pcvstack}
17
      \procedure {C} {
    c \sample C
18
19
20
         \pcreturn c
    \end{ pchstack }
```

1.3 Columns

The \pseudocode and \procedure commands allow the usage of multiple columns. You switch to a new column by inserting a \>. This is similar to using an align environment and placing a tabbing & character.¹

```
1  \pseudocodeblock{%
2  \textbf{First} \> \textbf{Second} \> \textbf{Third} \> \textbf{Fourth} \\
3  b \sample \bin \> b \sample \bin \> b \sample \bin \>
```

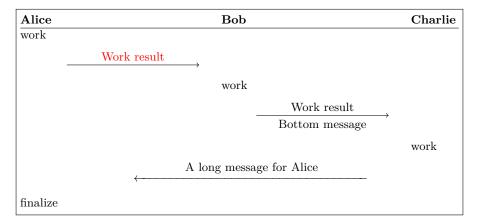

As you can see the first column is left aligned the second right, the third left and so forth. In order to get only left aligned columns you could thus always skip a column by using \>\> or you can alternatively use \< as a shorthand for \>\>.

$$\begin{array}{|c|c|c|c|c|c|} \hline \textbf{First} & \textbf{Second} & \textbf{Third} & \textbf{Fourth} \\ b \leftarrow \$ \left\{0,1\right\} b \leftarrow \$ \left\{0,1\right\} b \leftarrow \$ \left\{0,1\right\} b \leftarrow \$ \left\{0,1\right\} \end{array}$$

 $^{^1\}mathrm{In}$ fact, the pseudocode command is based on ams math's flalign environment.

1.4 Protocols

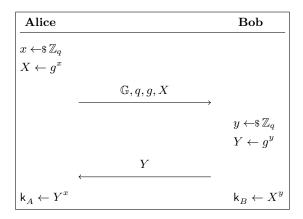

Using columns makes it easy to write even complex protocols. Following is a simple three-party protocol.

The commands \sendmessageright and \sendmessageleft are very flexible and allow to style the sending of messages in various ways. Also note the \\[][\hline] at the end of the first line. Here the first optional argument allows us to specify the lineheight (similarly to the behavior in an align environment) while the second optional argument allows us to, for example, draw a horizontal line.

In multi-player protocols such as the one above the commands \sendmessagerightx and \sendmessageleftx (note the x at the end) allow to send messages over multiple columns. In the example, as we were using \< the final message thus spans 8 columns.

For basic protocols you might also utilize the \sendmessageright* and \sendmessageleft* commands which simply take a message which is displayed (in math mode) on top.

```
 \begin{array}{l} 1 \\ \text{pseudocodeblock} \\ 2 \\ \text{textbf} & \text{Alice} \\ \text{Alice} \\ \text{Alice} & \text{Sobstineskip} \\ \text{Sobstineskip} \\ \text{Supplies of } & \text{
```

We will discuss protocols in greater detail in Section 5.

1.5 Game-Based Proofs

Cryptocode supports authors in visualizing game-based proofs. It defines an environment gameproof which allows to wrap a number of game procedures displaying helpful information as to what changes from game to game and to what each step is reduced.

Gan	$ne_1(n)$	$Game_2(n) \boxed{Game_3(n)}$	$Game_4(n)$
1:	Step 1	Step 1	Step 1
2:		From game 3 on	From game 3 on
3:	Step 2	Step 3 is different	Step 3 adapted again

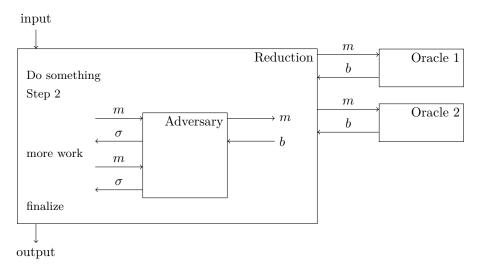

```
\begin { gameproof }
                                                     \begin{pchstack} [center, space=lem] \gameprocedure[linenumbering, minlineheight=1.5em] {%
         2
        4
5
6
7
8
9
                                                                                                   \text{Step 1}
                                                                                                 \text{Step 3}
                                                                          \verb|\tbxgameprocedure[minlineheight=1.5em]| \{\%
   10
                                                                                                           \text{Step 1} \\\pcbox{\text{From game 3 on}}
 11
12
13
14
15
                                                                                                           \gamechange{\text{Step 3 is different}}
                                                                          \gameprocedure[minlineheight=1.5em]{%
                                                                                                     text{Step 1} \\
text{From game 3 on}\\
16
                                                                                                 \text{\ } \text{\ 
 17
                                                                                                \text{\gamechange{Step 3 adapted again}}
18
19
20
                                                     \end{pchstack}
21
                               \end{gameproof}
```

Note that we made use of the option "mode=text" in the above example which tells the underlying pseudocode command to not work in math mode but in plain text mode. We will discuss how to visualize game-based proofs in Section 6.

1.6 Black-Box Reductions

Cryptocode provides a strucured syntax to visualize black-box reductions. Basically cryptocode provides an environment to draw boxes that may have oracles and/or challengers and that can be communicated with. Cryptocode makes heavy use of TIKZ (https://www.ctan.org/pkg/pgf) for this, which gives you quite some control over how things should look like. Additionally, as you can specify node names (for example the outer box in the next example is called "A") you can easily extend the pictures by using

plain TIKZ commands. Following is an example reduction. We discuss the details in Section 7.

```
\begin {bbrenv} {A}
       \begin {bbrbox} [name=Reduction]
 2
3
4
5
6
7
8
9
       \pseudocode{
          \text{Do something} \\
          \text{Step 2}
       \begin{bbrenv}{B}
          \begin {bbrbox} [name=Adversary, minheight = 2.25cm] \end{bbrbox}
10
11
12
          \bbrmsgto{top=$m$}
13
          \bbrmsgfrom \text{top=$\sigma$}
          \bbrmsgtxt{\pseudocode{%} \text{more work}
14
15
16
17
          \bbrmsgto{top=\m\}
18
          \bbrmsgfrom \top=\sigma\}
19
20
          \bbrqryto{side=$m$}
21
          \bbrqryfrom { side=$b$}
22
       \end{bbrenv}
23
24
       \pseudocode{
25
          \text{finalize}
26
27
28
       \end{bbrbox}
29
       \bbrinput{input}
30
       \bbroutput {output}
31
       \begin{bbroracle}{OraA} \\ \begin{bbrox}{brbox}{[name=Oracle 1, minheight=1cm]} \\ \end{bbrbox}
32
33
34
       \end{bbroracle}
35
       \bbroracleqryto{top=$m$}
\bbroracleqryfrom{top=$b$}
36
37
38
       \begin{bbroracle}{OraB} \begin{bbroracle}{OraB} \begin{bbrbox}[name=Oracle 2, minheight=1cm] \end{bbrbox}
39
40
41
       \end{bbroracle}
\bbroracleqryto{top=\sm\}
\bbroracleqryfrom{top=\s\}
42
43
44
    \end{bbrenv}
```

2 Notation Macros

In this section we'll discuss the various commands for notation that can be loaded via package options.

```
\usepackage[
     advantage,
     operators,
     sets,
     adversary,
     landau,
     probability,
     notions,
     logic,
11
     mm,
     primitives,
14
     events,
15
     complexity,
16
     oracles.
17
     asymptotics,
18
     kevs
     ]{cryptocode}
```

Remark. Note that the available command sets are far from complete and reflect my own work (especially once you get to cryptographic notions and primitives). In case you feel that something should be added feel free to drop me an email, or better yet, open an issue and pull request on github (https://github.com/arnomi/cryptocode).

2.1 Security Parameter

In cryptography we make use of a security parameter which is usually denoted by 1^n or 1^{λ} . The cryptocode package, when loading either option "n" or option "lambda" will define the commands

```
1 \secpar
2 \secparam
3 \SECPAR
```

The first command provides the "letter", i.e., either n or λ , whereas \secparam prints \1^\secpar (i.e., 1^n for option "n"). Finally, \SECPAR yields N_0 (resp. Λ) and is meant to be used in sentences such as, "there exists $N_0 \in \mathbb{N}$ such that for all $n \geq N_0$, …"

2.2 Advantage Terms

Load the package option "advantage" in order to define the command \advantage used to specify advantage terms such as:

$$\mathsf{Adv}^{\mathrm{prf}}_{\mathcal{A},\mathsf{PRF}}(n)$$

```
1 \advantage{prf}{\adv,\prf}
```

Specify an optional third parameter to replace the (n).

```
1 \advantage{prf}{\adv,\prf}[(arg)]
```

In order to redefine the styles in which superscript and subscript are set, or in case you want to replace the term Adv, redefine:

```
1 \renewcommand{\pcadvantagename}{\mathsf{Adv}}
2 \renewcommand{\pcadvantagesuperstyle}[1]{\mathrm{\MakeLowercase{#1}}}
3 \renewcommand{\pcadvantagesubstyle}[1]{#1}
```

2.3 Math Operators

The "operators" option provides the following list of commands:

Command	Description	Result	Example
\sample	Sampling from a distribution, or	← \$	$b \leftarrow \$ \{0, 1\}$
	running a randomized procedure		
\floor{42.5}	Rounding down	$\lfloor 42.5 \rfloor$	
\ceil{41.5}	Rounding up	$\lceil 41.5 \rceil$	
$\Lambda gle\{x,y\}$	Vector product	$\langle x, y \rangle$	
$\abs{\frac{a}{b}}$	Absolute number	$\left \frac{a}{b} \right $	
$\operatorname{norm}\{x\}$	Norm	x	
\concat	Verbose concatenation (I usually		$x \leftarrow a \ b$
	prefer simply \ \ \ \)		
\emptystring	The empty string	ε	$x \leftarrow \varepsilon$
\argmax	arg max	$\operatorname{arg} \max$	$ \operatorname{argmax}_{x \in S} f(x) $
\argmin	arg min	$rg \min$	$ \operatorname{argmin}_{x \in S} f(x) $
\pindist	Perfect indistinguishability	<u>P</u>	$X \stackrel{\mathrm{p}}{=} Y$
\sindist	Statistical indistinguishability	$\overset{\mathrm{s}}{\approx}$	$X \stackrel{\mathrm{s}}{\approx} Y$
\cindist	Computational indistinguisha-	≎≋	$X \stackrel{\mathrm{c}}{\approx} Y$
	bility		

The paired operators \floor , \ceil , \arrowvert , and \arrowvert also come in a form for flow text which does not scale the outer delimter. These are \truevert , \truevert , \truevert , \truevert , and \truevert , and \truevert , \truever

Note that $\arg\max$ and $\arg\min$ in block formulas will set their subscripts as limits, i.e.,:

$$\operatorname*{arg\,max}_{x\in S}f(x)$$

2.4 Adversaries

The "adversary" option provides the following list of commands:

Command	Description	Result
\adv	Adversary	$\overline{\mathcal{A}}$
\bdv	Adversary	${\cal B}$
\cdv	Adversary	\mathcal{C}
\ddv	Adversary	${\cal D}$
\edv	Adversary	${\cal E}$
\mdv	Adversary	\mathcal{M}
\pdv	Adversary	${\cal P}$
\rdv	Adversary	${\cal R}$
\sdv	Adversary	${\mathcal S}$

The style in which an adversary is rendered is controlled via

2.5 Landau

The "landau" option provides the following list of commands:

Command	Description	Result
\bigO{n^2}	Big O(micron) notation	$\mathcal{O}(n^2)$
$\mbox{smallO}(n^2)$	small o(micron) notation	$o(n^2)$
σ_n^2	Big Omega notation	$\Omega(n^2)$
$\displaystyle \begin{array}{l} \ \ \ \ \ \end{array}$	Big Theta	$\Theta(n^2)$
\orderOf	On the order of	$f(n) \sim q(n)$

2.6 Probabilities

The "probability" option provides commands for writing probabilities. Use

```
 \begin{array}{l} 1 & \begin{array}{l} \begin{array}{l} 1 & \end{array} \end{array} \end{array} \end{array} \end{array} \\ \begin{array}{l} 2 & \begin{array}{l} 1 & \begin{array}{l} 1 & \begin{array}{l} 1 & \begin{array}{l} 1 & 1 & 1 & 1 & 1 \\ \end{array} \end{array} \\ \begin{array}{l} 3 & \begin{array}{l} 1 & \begin{array}{l} 1 & 1 & 1 & 1 & 1 \\ \end{array} \end{array} \\ \begin{array}{l} 4 & \begin{array}{l} 1 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \end{array} \\ \begin{array}{l} 4 & \begin{array}{l} 1 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & \begin{array}{l} 1 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \end{array} \\ \begin{array}{l} 4 & \begin{array}{l} 1 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 & 1 \\ \end{array} \\ \begin{array}{l} 4 & 1 \\ \end{array} \\ \begin{array}{l} 4
```

to write basic probabilities, probabilities with explicit probability spaces and conditional probabilities.

$$\begin{aligned} & \Pr[X = x] \\ & \Pr_{x \leftarrow \$ \{0,1\}^n}[X = x] \\ & \Pr[X = x \mid A = b] \\ & \Pr_{x \leftarrow \$ \{0,1\}^n}[x = 5 \mid A = b] \end{aligned}$$

You can control the probability symbol (Pr) by redefining

```
1 \renewcommand {\probname} {Pr}
```

The probability commands have a flowtext version $\t X=X$ or $\t Condprob\{X=x\}\{Y=y\}$ which does not scale the delimiters. In case the probability space is more complex, you can use

which yields

$$\Pr[z=7: x, y \leftarrow \$ \{1, 2, 3, 4, 5, 6\}, z=x+y].$$

For specifying expectations the following commands are defined

```
1  \expect{X}
2  \expsub{x, y\sample\set {1,\ldots,6}}{x+y}
3  \condexp{X+Y}{Y>3}
4  \condexpsub{x, y\sample\set {1,\ldots,6}}{x+y}{y>3}
```

yielding

$$\begin{split} & \mathbb{E}[X] \\ & \mathbb{E}_{x,y \leftrightarrow \$\{1,...,6\}}[x+y] \\ & \mathbb{E}[X+Y\mid Y>3] \\ & \mathbb{E}_{x,y \leftrightarrow \$\{1,...,6\}}[x+y\mid y>3] \end{split}$$

Again flowtext versions such as X are available. To control the expactation symbol (\mathbb{E}) , redefine

The support Supp(X) of a random variable X can be written as

```
1 \quad \setminus \operatorname{supp} \{X\}
```

where again the name can be controlled via

```
1 \renewcommand{\supportname}{Supp}
```

For denoting entropy and min-entropy use

```
1 \entropy{X}
2 \minentropy{X}
3 \condentropy{X}{Y=5}
4 \condminentropy{X}{Y=5}
5 \condavgminentropy(X){Y=5}
```

This yields

$$\begin{split} & \operatorname{H}(X) \\ & \operatorname{H}_{\infty}(X) \\ & \operatorname{H}(X \mid Y = 5) \\ & \operatorname{H}_{\infty}(X \mid Y = 5) \\ & \tilde{\operatorname{H}}_{\infty}(X \mid Y = 5) \end{split}$$

2.7 Sets

The "sets" option provides commands for basic mathematical sets. You can write sets and sequences as

```
1 \set \{1, \ldots, 10\}
2 \sequence \{1, \ldots, 10\}
```

which are typeset as

$$\{1, \dots, 10\}$$
$$(1, \dots, 10)$$

In addition, the following commands are provided

Command	Description	Result
\bin	The set containing 0 and 1	$\{0,1\}$
\NN	Natural numbers	\mathbb{N}
\ZZ	Integers	$\mathbb Z$
\ QQ	Rational numbers	\mathbb{Q}
\CC	Complex numbers	\mathbb{C}
\RR	Reals	\mathbb{R}
\PP		\mathbb{P}
\FF		\mathbb{F}
\GG		\mathbb{G}

The style in which sets are being set can be adapted by redefining

2.8 Cryptographic Notions

The "notions" option defines the following list of commands:

Command	Description	Result
\indcpa	IND-CPA security for encryption schemes	IND-CPA
\indcca	IND-CCA security for encryption schemes	IND-CCA
\indccai	IND-CCA1 security for encryption schemes	IND-CCA1
\indccaii	IND-CCA2 security for encryption schemes	IND-CCA2
\ind	IND security	IND
\priv	PRIV security for deterministic public-key encryp-	PRIV
	tion schemes	
\prvcda	PRV-CDA security (for deterministic public-key en-	PRV-CDA
	cryption schemes)	
\prvrcda	PRV\$-CDA security (for deterministic public-key en-	PRV\$-CDA
	cryption schemes)	
\kiae	Key independent authenticated encryption	KIAE
\kdae	Key dependent authenticated encryption	KDAE
\mle	Message locked encryption	MLE
\uce	Universal computational extractors	UCE
\eufcma	Existential unforgeability under chosen message at-	EUF-CMA
	tack	
\eufnacma	Non-adaptive existential unforgeability under chosen	EUF-naCMA
	message attack	
\seufcma	Strong existential unforgeability under chosen mes-	SUF-CMA
	sage attack	
\eufko	Existential unforgeability under key only attack	EUF-KO

The style in which notions are displayed can be controlled via redefining

2.9 Logic

The "logic" option provides the following list of commands:

Command	Description	\mathbf{Result}
\AND	Logical AND	AND
\NAND	Logical NAND	NAND
\OR	Logical OR	OR
\NOR	Logical NOR	NOR
\XOR	Logical XOR	XOR
\XNOR	Logical XNOR	XNOR
\notimplies	Negated implication	\Rightarrow
\NOT	not	NOT
\xor	exclusive or	\oplus
\false	false	false
\true	true	true

2.10 Function Families

The "ff" option provides the following list of commands:

Command	Description	Result
\kgen	Key generation	KGen
\pgen	Parameter generation	Pgen
\eval	Evaluation	Eval
\invert	Inversion	Inv
\il	Input length	il
\ol	Output length	ol
\kl	Key length	kl
\nl	Nonce length	nl
\rl	Randomness length	rl

The style in which these are displayed can be controlled via redefining

2.11 Machine Model

The "mm" option provides the following list of commands:

Command	Description	Result
\CRKT	A circuit	С
\TM	A Turing machine	M
\PROG	A program	Р
\uTM	A universal Turing machine	UM
\uC	A universal Circuit	UC
\uP	A universal Program	UEval
\tmtime	Time (of a TM)	time
\ppt	Probabilistic polynomial time	PPT

The style in which these are displayed can be controlled via redefining

```
1 \quad \\ \\ | \text{location} \\ | \text{
```

2.12 Crypto Primitives

The "primitives" option provides the following list of commands:

Command	Description	Result
\prover	Proover	Р
\verifier	Verifier	V
\nizk	Non interactie zero knowledge	NIZK
\hash	A hash function	Н
\gash	A hash function	G
\fash	A hash function	F
\pad	A padding function	pad
\enc	Encryption	Enc
\dec	Decryption	Dec
\sig	Signing	Sig
\sign	Signing	Sign
\verify	Verifying	Vf
\owf	One-way function	OWF
\prf	Pseudorandom function	PRF
\prp	Pseudorandom permutation	PRP
\prg	Pseudorandom generator	PRG
\obf	Obfuscation	Ο
\i0	Indistinguishability obfuscation	iO
\diO	Differing inputs obfuscation	diO
\mac	Message authentication	MAC
\puncture	Puncturing	Puncture
\source	A source	S
\predictor	A predictor	Р
\sam	A sampler	Sam
\distinguisher	A distinguisher	Dist
\dist	A distinguisher	D
\simulator	A simulator	Sim
\extractor	An extractor	Ext
\ext	Shorthand for \extractor	Ext

The style in which these are displayed can be controlled via redefining

```
1 \quad \text{$$ \operatorname{\command} {\operatorname{\command} {\operatorname{\comm} {\operatorname{\command} {\operatorname{\command} {\operatorname{\command} {\operatorname{\comm} {\operatorname{\command} {
```

2.13 Oracles

The "oracles" option provides the following list of commands:

Command	Description	\mathbf{Result}
\oracle	Generic oracle	0
\oracle[LoR]	Custom oracle	LoR
\ro	Random oracle	RO
\Oracle{\sign}	Oracle version of procedure	OSign

The style in which these are displayed can be controlled via redefining

2.14 Events

The "events" option provides the following list of commands.

Command	Description	Result
\event{E}	Event E	E
\nevent{E}	Negated event ${\sf E}$	Ē
\bad	Bad event	bad
\nbad	Bad event	bad

2.15 Complexity

The "complexity" option provides the following list of commands:

Command	Result
\complclass{myClass}	myClass
\cocomplclass{myClass}	co-myClass
\npol	NP
\conpol	co-NP
\pol	Р
\bpp	BPP
\ppoly	P/poly
\NC{1}	NC^1
\AC{1}	AC^1
\TC{1}	TC^1
\AM	AM
\coAM	co-AM
\PH	PH
\csigma{1}	Σ^p_1
\cpi{1}	Π^p_1
\cosigma{1}	$co extstyle{-}\Sigma^p_1$
\copi{1}	со- Π^p_1

The style in which these are displayed can be controlled via redefining

2.16 Asymptotics

The "asymptotics" option provides the following list of commands:

Description	Result
A negligible function	$negl(n) \; (n \; is \; \setminus secpar)$
A negligible function	negl(x)
A negligible function	negl
A polynomial	$poly(n) \; (n \; is \; \setminus secpar)$
A polynomial	poly(x)
A polynomial	poly
some polynomial ${\sf p}$	р
some custom polynomial t	t
some polynomial c	С
some polynomial e	e
some polynomial k	k
some polynomial m	m
some polynomial n	n
some polynomial ${\sf q}$	q
some polynomial r	r
	A negligible function A negligible function A negligible function A polynomial A polynomial A polynomial some polynomial p some custom polynomial t some polynomial c some polynomial e some polynomial k some polynomial m some polynomial n some polynomial q

The style in which these are displayed can be controlled via redefining

2.17 Keys

The "keys" option provides the following list of commands:

Command	Description	Result
pk	public key	pk
vk	verification key	vk
sk	secret key	sk
key	a plain key	k
key[xk]	custom key	xk
hk	hash key	hk
gk	gash key	gk
fk	function key	fk
st	state	st
state	state	state
$state\{myState\}$	custom state	state myState

The style in which these are displayed can be controlled via redefining

```
1 \quad \text{$$ \operatorname{\mathbf{A}}(\mathbf{x})$ } 1 \quad \text{$$ \operatorname{\mathbf{A}}
```

3 Pseudocode

3.1 Basics

The cryptocode package provides the command \pseudocode for typesetting algorithms. Consider the following definition of an IND-CPA game

```
\begin{aligned} b &\leftarrow \$ \left\{ 0,1 \right\} \\ (\mathsf{pk},\mathsf{sk}) &\leftarrow \$ \, \mathsf{KGen}(1^n) \\ (m_0,m_1) &\leftarrow \$ \, \mathcal{A}(1^n,\mathsf{pk},c) \\ c &\leftarrow \$ \, \mathsf{Enc}(\mathsf{pk},m_b) \\ b' &\leftarrow \$ \, \mathcal{A}(1^n,\mathsf{pk},c) \\ \mathbf{return} \, \, b &= b' \end{aligned}
```

which is generated by

```
begin{pchstack}[center]

pseudocode{
    b \sample \bin \\
    (\pk,\sk) \sample \kgen (\secparam) \\
    (m_0,m_1) \sample \adv(\secparam, \pk, c) \\
    c \sample \enc(\pk,m_b) \\
    b' \sample \adv(\secparam, \pk, c) \\
    pcreturn b = b' }

end{pchstack}
```

First note that \pseudocode on its own does not space itself. For laying out one (or multiple) code blocks cryptocode defines stacking environemnts such as \pchstack and \pcvstack that we discuss in Section 3.7. Wrapping a single pseudocode in a \pchstack as in the above example generates a nicely offset code block.

As code blocks are most often not used in flow text, cryptocode offers the shorthand \pseudocodeblock which centers and offsets a pseudocode block as above. We thus get the very same by writing

We can also define custom block commands, for example, the following defines a command \pcb that offsets and centers code and draws a tight fitting box around the code block:

```
\label{lock} $$ \operatorname{createpseudocodeblock}(\operatorname{pcb}_{\operatorname{center}},\operatorname{boxed}_{\{\}}_{\{\}}_{\{\}}$$
```

(We discuss creating custom pseudocode commands in detail in Section 3.1.2). If we now use \pcb as just defined in the above example, we obtain the following nicely spaced and boxed result.

```
\begin{cases} b \leftarrow \$ \{0,1\} \\ (\mathsf{pk},\mathsf{sk}) \leftarrow \$ \mathsf{KGen}(1^n) \\ (m_0,m_1) \leftarrow \$ \mathcal{A}(1^n,\mathsf{pk},c) \\ c \leftarrow \$ \mathsf{Enc}(\mathsf{pk},m_b) \\ b' \leftarrow \$ \mathcal{A}(1^n,\mathsf{pk},c) \\ \mathbf{return} \ b = b' \end{cases}
```

which is generated as

Remark. In the following we will use this boxed representation for the examples, but use \pseudocodeblock in the corresponding code listings.

As you can see, the pseudocode command provides a math based environment where you can simply start typing your pseudocode separating lines by \\.

3.1.1 Customizing Pseudocode

Besides the mandatory argument the \pseudocode command can take an optional argument which consists of a list of key=value pairs separated by commas.

```
1 \pseudocode[options]{body}
```

The following parameters are available:

head A header for the code

width An exact width. If no width is specified, cryptocode tries to automatically compute the correct width.

Instart The starting line number when using line numbering.

Instartright The starting line number for right aligned line numbers when using line numbering.

linenumbering Enables line numbering.

skipfirstln Starts line numbering on the second line.

minlineheight Specify a minimum height for each line. Can be globally set by redefining \pcminlineheight.

syntaxhighlight When set to "auto" cryptocode will attempt to automatically hightlight keywords such as "for", "foreach" and "return". Note that this feature should be regarded as experimental. In particular, it is rather slow.

keywords Provide a comma separated list of keywords for automatic syntax highlighting. To customize the behavior of automatic spacing you can provide keywords as

keywordsindent After seeing this keyword all following lines will be indented one extra level.

keywordsunindent After seeing this keyword the current and all following lines will be unindented one extra level.

keywordsuninindent After seeing this keyword the current line will be unindented one level.

addkeywords Provide additional keywords for automatic syntax highlighting.

altkeywords Provide a second list of keywords for automatic syntax highlighting that are highlighted differently.

mode When set to text pseudocode will not start in math mode but in text mode.

space Allows you to enable automatic spacing mode. If set to "keep" the spaces in the input are preserved. If set to "auto" it will try to detect spacing according to keywords such as "if" and "fi".

codesize Allows to specify the fontsize for the pseudocode. Set to \scriptsize for a smaller size.

colspace Allows to insert spacing between columns. In particular this allows to also overlap columns by inserting negative space.

jot Allows to specify extra space between each line. Use jot=1mm.

beginline Allows to specify a macro that is placed at the beginning of each line.

endline Allows to specify a macro that is placed at the end of each line.

xshift Allows horizontal shifting

yshift Allows horizontal shifting

headlinesep Specifies the distance between header and the line. By default set to 0pt which can be globally overwritten by setting length \pcheadlinesep.

bodylinesep Specifies the distance between body and the line. By default set to 0.3\baselineskip which can be globally overwritten by setting length \pcbodylinesep.

colsep Defines the space between columns.

headheight Specifies the height of the header. By default set to 3.25ex which can be globally overwritten by setting length \pcheadheight.

headlinecmd Allows to overwrite which command is used to draw the bar below the headline. Defaults to \hrule.

addtolength Is added to the automatically computed width of the pseudocode (which does not take colsep into account).

valign Controls the vertical alignment of the pseudocode. Pseudocode is wrapped in a minipage environment and valign value is passed as orientation for the minipage. By default valign is set to "t".

nodraft Forces syntax highlighting also in draft mode.

The following code

\pseudocodeblock[linenumbering,syntaxhighlight=auto,head=Header]{ return null }

creates

 $\frac{\text{Header}}{\text{1: } \mathbf{return null}}$

3.1.2 Customized Pseudocode Commands

Besides the \pseudocode and \pseudocodeblock command the command \procedure (and its block variant \procedureblock provides easy access to generate code with a header. They take the following form

```
1 \procedure[options]{Header}{Body}
2 \procedureblock[options]{Header}{Body}
```

Examples

```
\frac{\text{IND-CPA}_{\mathsf{Enc}}^{\mathcal{A}}(n)}{b \leftarrow \$ \{0,1\}}
(\mathsf{pk}, \mathsf{sk}) \leftarrow \$ \mathsf{KGen}(1^n)
(m_0, m_1) \leftarrow \$ \mathcal{A}(1^n, \mathsf{pk}, c)
c \leftarrow \$ \mathsf{Enc}(\mathsf{pk}, m_b)
b' \leftarrow \$ \mathcal{A}(1^n, \mathsf{pk}, c)
\mathbf{return} \ b = b'
```

which is generated as

```
1  \procedureblock{$\indcpa_\enc^\adv(\secpar)$}{
2         b \sample \bin \\
3         (\pk,\sk) \sample \kgen(\secparam) \\
4         (m_0,m_1) \sample \adv(\secparam, \pk, c) \\
5         c \sample \enc(\pk,m_b) \\
6         b' \sample \adv(\secparam, \pk, c) \\
7         \preference \chisplace \chi
```

You can define customized pseudocode commands which either take one optional argument and two mandatory arguments (as the procedure command) or one optional and one mandatory argument (as the pseudocode command). The following

creates the commands \mypseudocode and \myprocedure with line numbering always enabled as well as the block commands \pcb and \procb also with line numbering enabled. The created commands have an identical interface as the \pseudocode (resp. \procedure) command. The two arguments that we kept empty when generating the commands allows us to specify commands that are executed at the very beginning when the command is called (first empty argument) and a prefix for the header. For example, the command created as

```
l \createprocedureblock { expproc } { center , boxed } { } { $ \mathbb{Experiment} $ xspace } { linenumbering }
```

could be used as

```
\[ \\ \exproc{\\index\proc\adv(\secpar)\$\}{\} \\ b \sample \bin \\ \\ \\ (\pk,\sk) \sample \kgen(\secparam) \\ \\ (m_0,m_1) \sample \adv(\secparam, \pk, c) \\ \\ c \sample \enc(\pk,m_b) \\ \\ b' \sample \adv(\secparam, \pk, c) \\ \\ \\ \pcreturn b = b' \} \]
```

This results in

```
Experiment IND-CPA_{\mathsf{Enc}}^{\mathcal{A}}(n)

1: b \leftarrow \$ \{0,1\}

2: (\mathsf{pk},\mathsf{sk}) \leftarrow \$ \mathsf{KGen}(1^n)

3: (m_0,m_1) \leftarrow \$ \mathcal{A}(1^n,\mathsf{pk},c)

4: c \leftarrow \$ \mathsf{Enc}(\mathsf{pk},m_b)

5: b' \leftarrow \$ \mathcal{A}(1^n,\mathsf{pk},c)

6: \mathsf{return}\ b = b'
```

3.2 Indentation

In order to indent code use \pcind or short \t. You can also use customized spacing such as \quad or \hspace when using the pseudocode command in math mode.

```
for i = 1..10 do
T[i] \leftarrow \$ \{0, 1\}^n
for i = 1..10 do
T[i] \leftarrow \$ \{0, 1\}^n
```

which is generated as

```
1  \pseudocodeblock{
2     \pcfor i = 1..10 \pcdo \\
3     \pcind T[i] \sample \bin^n \\
4     \pcfor i = 1..10 \pcdo \\
5     \tau T[i] \sample \bin^n }
```

You can specify multiple levels via the optional first argument

```
1 \t[level] % \pcind[level]
```

```
 \begin{aligned} & \textbf{for } i = 1..10 \ \textbf{do} \\ & T[i] \leftarrow \$ \left\{ 0, 1 \right\}^n \\ & T[i] \leftarrow \$ \left\{ 0, 1 \right\}^n \\ & T[i] \leftarrow \$ \left\{ 0, 1 \right\}^n \\ & T[i] \leftarrow \$ \left\{ 0, 1 \right\}^n \\ & T[i] \leftarrow \$ \left\{ 0, 1 \right\}^n \end{aligned}
```

```
1  \pseudocodeblock{
2     \pcfor i = 1..10 \pcdo \\
3     \t T[i] \sample \bin^n \\
4     \t\t T[i] \sample \bin^n \\
5     \t[3] T[i] \sample \bin^n \\
6     \t[4] T[i] \sample \bin^n \\
7     \t[5] T[i] \sample \bin^n \\
```

You can customize the indentation shortcut by redefining

```
1 \renewcommand{\pcindentname}{t}
```

Automatic Indentation

The pseudocode command comes with an option "space=auto" which tries to detect the correct indentation from the use of keywords. When it sees one of the following keywords

```
1 \pcif, \pcfor, \pcwhile, \pcrepeat, \pcforeach
```

it will increase the indentation starting from the next line. It will again remove the indentation on seeing

```
l \pcfi, \pcendif, \pcendfor, \pcendwhile, \pcuntil, \pcendforeach
```

Additionally, on seeing

```
1 \pcelse, \pcelseif
```

it will remove the indentation for that particular line. Thus the following

```
for a \in [10] do

for a \in [10] do

for a \in [10] do

if a = b then

some operation

elseif a = c then

some operation

else

some default operation

fi

endfor

endfor

return a
```

can be obtained by:

```
1  \pseudocodeblock[space=auto]{%
2  \pcfor a \in [10] \pcdo \\
3  \pcfor a \in [10] \pcdo \\
4  \pcfor a \in [10] \pcdo \\
5  \pcif a = b \pcthen \\
6  \text{some operation} \\
```

Note that the manual indentation in the above example is not necessary for the outcome. Further note that the same works when using automatic syntax highlighting (see Section 3.4).

Keep Input Indentation (experimental)

The pseudocode package comes with an *experimental* feature that preserves the spacing in the input. This can be enabled with the option "space=keep".

This yields the following result

```
for i = 1..10 do
T[i] \leftarrow \$ \{0,1\}^n
```

Note that automatic spacing only works when the \pseudocode command is not wrapped within another command. Thus in order to get a frame box \fbox{\pseudocode[space=keep]{code}} will not work but you would need to use an environment such as one offered by the *md-framed* package ((https://www.ctan.org/pkg/mdframed). Also see Section 8.1.

3.3 Textmode

By default pseudocode enables LATEX' math mode. You can change this behavior and tell the pseudocode command to interpret the content in text mode by setting the option "mode=text".

```
This is simply text
```

```
1 \pseudocodeblock[mode=text]{%
2 This is \\
1 \t simply text}
```

3.4 Syntax Highlighting

In the above examples we have used commands \pcreturn and \pcfor to highlight certain keywords. Besides the *pcreturn*, *pcfor* and *pcdo* (where the pc stands for pseudocode) that were used in the above examples the package defines the following set of constants:

1	4
command	outcome
\pcabort	abort
\pccontinue	continue
\pccomment{comment}	// comment
\pccomment[2em]{comment}	// comment
\pclinecomment{comment}	// comment
\pcdo	do
\pcdone	\mathbf{done}
\pcfail	fail
\pcfalse	false
\pcif	\mathbf{if}
\pcfi	fi
\pcendif	endif
\pcelse	else
\pcelseif	elseif
\pcfor	for
\pcendfor	endfor
\pcforeach	foreach
\pcendforeach	endforeach
\pcglobvar	gbl
\pcin	$\mathbf{i}\mathbf{n}$
\pcnew	new
\pcnull	null
\pcparse	parse
\pcrepeat{10}	repeat 10 times
\pcreturn	return
\pcuntil	${f until}$
\pcthen	then
\pctrue	true
\pcwhile	while
\pcendwhile	endwhile

Note that \pcdo, \pcin and \pcthen have a leading space. This is due to their usual usage scenarios such as

for
$$i$$
 in $\{1, ..., 10\}$

Furthermore all constants have a trailing space. This can be removed by adding the optional parameter [] such as

for
$$iin{1, ..., 10}$$

In order to change the font you can overwrite the command $\$ which is defined as

3.4.1 Automatic Syntax Highlighting (Experimental)

The pseudocode command comes with an experimental (and rather slow) feature to automatically highlight keywords. This can be activated via the option "syntaxhighlight=auto". The preset list of keywords it looks for are

```
for ,foreach ,{return },return ,{ do },{ in },new,if , null , true ,{until },{ to },
false ,{ then},repeat ,else if ,elseif ,while ,else ,done
```

Note that the keywords are matched with spaces and note the grouping for trailing spaces. That is, the "do" keyword won't match within the string "don't". Via the option "keywords" you can provide a custom list of keywords. Thus the following bubblesort variant (taken from http://en.wikipedia.org/wiki/Bubble_sort)

can be typeset as

You can also define additional keywords using the "addkeywords" option. This would allow us to specify "length" and "swap" in the above example.

can be typeset as

We can also combine automatic syntax highlighting with automatic spacing in which case we need to insert "group end" keywords:

```
\frac{\text{Bubblesort}(A: \text{list of items})}{n \leftarrow \text{length}(A)}
repeat
s \leftarrow \text{false}
for \ i = 1 \ to \ n - 1 \ do
// \text{ assuming this pair is out of order}
if \ A[i-1] > A[i] \ then
// \text{ swap them and remember something changed}
swap(A[i-1], A[i])
s \leftarrow true
endif
endfor
until \ \neg s
```

```
\procedureblock[space=auto,syntaxhighlight=auto,addkeywords={swap,length}]{
Bubblesort(A: list of items)}{
n \gets length(A) \\
repeat \\
s \gets false \\
for i=1 to n-1 do \\
pclinecomment{assuming this pair is out of order} \\
if A[i-1]>A[i] then \\
pclinecomment{swap them and remember something changed} \\
\end{array}
\]
```

Alternative Keywords

There is a second keyword list that you can add keywords to which are highlighted not via \highlightkeyword but via \highlightaltkeyword where alt stands for alternate. This allows you to have two different keyword styles which are by default defined as

This allows you to rewrite the above example and emphasize the different nature of swap and length.

```
\begin{aligned} & \text{Bubblesort}(\text{A}: \text{list of items}) \\ & n \leftarrow \text{length } (A) \\ & \textbf{repeat} \\ & s \leftarrow \textbf{false} \\ & \textbf{for } i = 1 \textbf{ to } n - 1 \textbf{ do} \\ & \text{\# assuming this pair is out of order} \\ & \textbf{if } A[i-1] > A[i] \textbf{ then} \\ & \text{\# swap them and remember something changed} \\ & \textbf{swap } (A[i-1], A[i]) \\ & s \leftarrow \textbf{true} \\ & \textbf{endif} \\ & \textbf{endfor} \\ & \textbf{until } \neg s \end{aligned}
```

Draft Mode

Automatic syntax highlighting is a somewhat expensive operation as it requires several rounds of regular expression matching. In order to speed up compilation the pseudocode command will not attempt automatic highlighting when the document is in draft mode. When in draft mode and you want to force a specific instance of \pseudocode to render the code with automatic syntax highlighting you can use the option nodraft.

3.5 Line Numbering

The pseudocode command allows to insert line numbers into pseudocode. You can either manually control line numbering or simply turn on the option linenumbering.

```
 \frac{\text{IND-CPA}_{\mathsf{Enc}}^{\mathcal{A}}(1^n)}{1: b \leftarrow \$ \{0, 1\}} \\ 2: (\mathsf{pk}, \mathsf{sk}) \leftarrow \$ \mathsf{KGen}(1^n) \\ 3: (m_0, m_1) \leftarrow \$ \mathcal{A}(1^n, \mathsf{pk}, c) \\ 4: c \leftarrow \$ \mathsf{Enc}(\mathsf{pk}, m_b) \\ 5: b' \leftarrow \$ \mathcal{A}(1^n, \mathsf{pk}, c) \\ 6: \mathbf{return} \ b = b'
```

is generated by

Note that you can use labels. In the above example \label{my:line:label} points to 3.

3.5.1 Skipping Line Numbers

When using automatic line numbering, you can skip line numbers by inserting a \pcskipln command. This causes the line number on the *next line* to be supressed. In order to suppress the first line number use the option skipfirstln. Thus the following

```
// Some comment on first line

1: Some code
// Some other comment

2: Some code
```

is generated by

```
1  \pseudocodeblock[linenumbering,skipfirstln,mode=text]{
2  \pclinecomment{Some comment on first line} \\
3  Some code \pcskipln\\
4  \pclinecomment{Some other comment} \\
5  Some code }
```

3.5.2 Manually Inserting Line Numbers

In order to manually insert line numbers use the command \pcln.

```
IND-CPA_{\mathsf{Enc}}^{\mathcal{A}}(1^n)

1: b \leftarrow \$\{0,1\}

2: (\mathsf{pk},\mathsf{sk}) \leftarrow \$\mathsf{KGen}(1^n)

3: (m_0,m_1) \leftarrow \$\mathcal{A}(1^n,\mathsf{pk},c)

4: c \leftarrow \$\mathsf{Enc}(\mathsf{pk},m_b)

5: b' \leftarrow \$\mathcal{A}(1^n,\mathsf{pk},c)

6: \mathsf{return}\ b = b'
```

is generated by

Note that labels also work when manually placing line numbers. In the above example label *my:line:label2* points to line number 3.

3.5.3 Start Values

You can specify the start value (minus one) of the counter by setting the option lnstart.

```
1 \procedure[lnstart=10,linenumbering]{Header}{Body}
```

```
\frac{\text{IND-CPA}_{\mathsf{Enc}}^{\mathcal{A}}(1^n)}{11: b \leftarrow \$ \{0, 1\}}
12: (\mathsf{pk}, \mathsf{sk}) \leftarrow \$ \mathsf{KGen}(1^n)
13: (m_0, m_1) \leftarrow \$ \mathcal{A}(1^n, \mathsf{pk}, c)
14: c \leftarrow \$ \mathsf{Enc}(\mathsf{pk}, m_b)
15: b' \leftarrow \$ \mathcal{A}(1^n, \mathsf{pk}, c)
16: \mathbf{return} \ b = b'
```

3.5.4 Separators

The command \pclnseparator defines the separator between code and line number. By default the left separator is set to (:) colon. Also see Section 5.3.1.

3.5.5 Style

The style in which line numbers are set can be controlled by redefining \pclnstyle.

```
\label{lem:command} $$\operatorname{\colored} \operatorname{\colored} \operatorname{\col
```

For example, to set line numbers in normal font and dot separated use

```
1 \renewcommand {\pclnstyle } [1] {\text{#1}} 2 \renewcommand {\pclnseparator } {.}
```

3.6 Subprocedures

The pseudocode package allows the typesetting of subprocedures such as

To create a subprocedure use the **subprocedure** environment. The above example is generated via

```
procedureblock[linenumbering]{$\indcpa_\enc^\adv(\secparam)$}{%}

b \sample \bin \\
(\pk,\sk) \sample \kgen(\secparam) \\
(m_0,m_1) \sample \begin{subprocedure}%

dbox{\procedure{\$\adv(\secparam, \pk, c)$}{%}

text{Step 1} \\
text{Step 2} \\
pcreturn m_0, m_1 }\
end{subprocedure} \\
c \sample \enc(\pk,m_b) \\
b' \sample \adv(\secparam, \pk, c) \\
pcreturn b = b' }
```

Here the dbox command (from the dashbox package) is used to generate a dashed box around the sub procedure.

3.6.1 Numbering in Subprocedures

As subprocedures are simply normal pseudocode blocks, you can use easily add line numbers. By default the line numbering starts with 1 in a subprocedure while ensuring that the outer numbering remains intact. Also note that the linenumbering on the outer procedure in the above example is inherited by the subprocedure. For more control, either use manual numbering or set the option "linenumbering=off" on the \pseudocode command within the subprocedure.

3.7 Stacking Procedures

You can stack procedures horizontally or vertically using the environments "pchstack" and "pcvstack".

```
1 \begin{pchstack}[options] body \end{pchstack}
2 \begin{pcvstack}[options] body \end{pcvstack}
```

The following example displays two procedures next to one another. To space two horizontally outlined procedures use the space option or manually insert spaces via \pchspace which takes an optional length as a parameter.

Similarly you can stack two procedures vertically using the "pcvstack" environment. As a spacing between two vertically stacked procedures again use either the space option or insert space manually via \pcvspace which takes an optional length as a parameter.

```
\left\{ \operatorname{begin} \left\{ \operatorname{pcvstack} \right\} \left[ \operatorname{boxed}, \operatorname{center}, \operatorname{space} = 0.5 \operatorname{em} \right] \right]
           \label{eq:continuous_procedure_liminary} $$ b \sim \left( \frac{bi}{k} \right) $$ b \sim \left( \frac{bi}{k} \right) $$ (\pk, \sk) \sim \left( \frac{c}{k} \right) $$ (\mbox{$m_0, m_1$} \sample \adv^O(\secparam , \pk) \ \c \sim \left( \frac{b' \sample \adv(\secparam , \pk, c) \ \pcreturn \ b = b' \ \} $$
  3
  4
5
 6
7
8
9
10
          % alternatively use \pcvspace for spacing
11
12
13
           \procedure[linenumbering, mode=text]{Oracle $O$}{%
                    Some code \\
14
                    Some more code
15
      \end{pcvstack}
16
```

Horizontal and vertical stacking can be combined

```
IND-CPA_{\mathsf{Enc}}^{\mathcal{A}}(1^n)
                                                            IND-CPA_{\mathsf{Enc}}^{\mathcal{A}}(1^n)
    1: b \leftarrow \$ \{0, 1\}
                                                              1: b \leftarrow \$ \{0, 1\}
    2: (pk, sk) \leftarrow \$ KGen(1^n)
                                                              2: (\mathsf{pk}, \mathsf{sk}) \leftarrow \$ \mathsf{KGen}(1^n)
    3: (m_0, m_1) \leftarrow \mathcal{A}^O(1^n, \mathsf{pk})
                                                             3: (m_0, m_1) \leftarrow \mathcal{A}^O(1^n, \mathsf{pk})
    4: c \leftarrow \$ \operatorname{Enc}(\operatorname{pk}, m_b)
                                                             4: c \leftarrow \$ \operatorname{Enc}(\mathsf{pk}, m_b)
    5: b' \leftarrow \mathcal{A}(1^n, \mathsf{pk}, c)
                                                             5: b' \leftarrow \mathcal{A}(1^n, \mathsf{pk}, c)
    6: return b = b'
                                                             6: return b = b'
Oracle O
                                      Oracle H_1
                                                                            Oracle H_2
 1: Some code
                                       1: Some code
                                                                              1: Some code
        Some more code
                                       2: Some more code
                                                                             2: Some more code
```

```

```

3.7.1 Stacking Options

The following keys are available on both pchstack and pcvstack environments

center Centers the stack.

boxed Draws a box around the stack.

space Controls the space between two pseudocode blocks within a stack. The default is 0pt which can be adapted globally by redefining \pchstackspace or \pcvstackspace.

noindent Does not indent the stack. Only applies if option center is not used.

inline Ensures that no paragraph is added by pchstack. This cannot be used together with either center or noindent.

aboveskip By default the outer most stack adds vertical space above. The default space added is **\abovedisplayskip** and can be adapted by redefining **\pcaboveskip**.

belowskip By default the outer most stack adds vertical space below. The default space added is \belowdisplayskip and can be adapted by redefining \pcbelowskip. Note that the defualt space below will not be added when used in a floating environment such as a figure. However, when manually setting belowskip it will always be added.

3.8 Default Arguments

You can set the default arguments to be used with pseudocode blocks via \pcsetargs. This is especially handy in stacking environments to add arguments to all enclosed code blocks.

```
Some Procedue ASome Procedue BSome Procedue C1: Step 11: Step 11: Step 12: Step 22: \binom{A}{B+C}2: Step 23: Step 33: Step 3
```

```
| begin{pchstack}[space=lem,center,boxed] | % Do not change size to scriptsize for line numbers | \renewcommand\pclnstyle[1]{#1} | % set default arguments for all pseudocode blocks in this hstack
```

```
\protect\operatorname{args}\{ posetargs \{ posetargs \} \} 
8
     \procedure{Some Procedue A}{
       Step 1\\
Step 2 }
9
10
11
     \procedure{Some Procedue B}{
12
13
        \text{Step 1}\\
        \label{lem:condition} $$ \vec{s} = \frac{pcmbox}{begin} {pmatrix}A \ \ B + C \ \ d{pmatrix} \ \ d{pcmbox} $$
14
        }$\\
        \text{Step 3}}
15
16
17
     \procedure{Some Procedue C}{
        Step 1\\
Step 2 }
18
19
20
   \end{pchstack}
```

Default Arguments for Stacking

Similarly to \pcsetargs you can define default arguments for hstack and vstack environments via \pcsethstackargs and \pcsetvstackargs.

3.9 Divisions and Linebreaks

Within the pseudocode command you generate linebreaks as \\. In order to specify the linewidth you can add an optional argument

```
1 \\[height]
```

Furthermore, you can add horizontal lines by using the second optional argument and write

```
1 \\[][\hline]
```

```
| \procedureblock [linenumbering] {\$\indcpa_\enc^\adv(\secparam)\$\} {\% b \sample \bin \\[2\baselineskip][\hline\hline] \\ (\pk,\sk) \sample \kgen(\secparam) \\ (m_0,m_1) \sample \adv^O(\secparam, \pk) \\ c \sample \enc(\pk,m_b) \\ b' \sample \adv(\secparam, \pk, c) \\ pcreturn b = b' }
```

3.9.1 Optimizing Layout

In case you are laying out multiple procedures horizontally, procedures may be slightly misaligned if the procedure headings are not of the same height. As an example, Consider the following setup

$\underbrace{\text{Procedure } A}_{}$		Procedure $B_{G_1}^{F^{h^*}}$	
1:			do
2:	some	2:	some
3:	work	3:	work

Here the sub and double superscripts in Procedure B make the header slightly larger than the maximum alotted space provided for headers which causes procedure B to be slightly shifted to the bottom. The best way to remedy such a situation is to use a combination of the headheight and headlinesep properties to increase the header space in both procedures and shift back the headline for a more compact visualization. As we here want to set some arguments for all procedure blocks within the stacking environment we can use $\poline{100}$

```
Procedure A Procedure B_{G_1}^{F^{h^*}}

1: do

2: some

3: work

3: work
```

```
\begin { pchstack } [ center , space=1ex ]
 2
       \pcsetargs{headheight=5ex, headlinesep=-1ex}
      \procedure[linenumbering]{Procedure $A$}{
         \text{do}\\
          text (some)
         \text{work}
      \label{linear} $$ \operatorname{procedure} [\operatorname{lineaumbering}] {\operatorname{Procedure} $B^{f^{h^*}}_{G_1}} $$
10
11
         \text{do}\\
12
         \text{some}
13
         \text{work}
14
   \end{pchstack}
```

3.10 Matrices and Math Environments within Pseudocode

In order to work its magic, cryptocode (in particular within the \pseudocode command) mingles with a few low level commands such as \\ or \halign. The effect of this is, that when you use certain math environments, for example, to create matrices, within pseudocode the result may be unexpected. Consider the following example

which, somewhat unexpectedly, yields

compute
$$P = \begin{pmatrix} A & \\ & B+C \end{pmatrix}$$

Here, the alignment is somewhat off. In order, to allow for the *pmatrix* environment to properly work without interference from \pseudocode you can wrap it into a pcmbox environment (where pcmbox is short for pseudocode math box). This ensures that the low-level changes introduced by \pseudocode are not active.

```
1  \pseudocodeblock{
2  \text{compute } P = \begin{pcmbox}\begin{pmatrix}
3     A \ B + C
4  \end{pmatrix}\end{pcmbox}
5
```

compute
$$P = \begin{pmatrix} A \\ B+C \end{pmatrix}$$

3.11 Fancy Code with Overlays

Consider the IND-CPA game. Here we have a single adversary \mathcal{A} that is called twice, first to output two messages and which is then given the ciphertext of one of the messages in order to "guess" which one was encrypted. Often this is not visualized. Sometimes an additional state state is passed as we have in the following example on the left. On the right, we visualize the same idea in a slightly more fancy way.

```
 \begin{array}{llll} & & & & & & & & & & & \\ & & & & & & \\ 1: & b \leftarrow \$ \left\{ 0,1 \right\} & & & & & \\ 2: & (\mathsf{pk},\mathsf{sk}) \leftarrow \$ \, \mathsf{KGen}(1^n) & & & \\ 3: & (\mathsf{state},m_0,m_1) \leftarrow \$ \, \mathcal{A}(1^n,\mathsf{pk},c) & & & \\ 4: & c \leftarrow \$ \, \mathsf{Enc}(\mathsf{pk},m_b) & & & \\ 5: & b' \leftarrow \$ \, \mathcal{A}(1^n,\mathsf{pk},c,\mathsf{state}) & & & \\ 6: & \mathbf{return} \, b = b' & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & \\ & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & \\ & & & \\ & & \\ & & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\
```

The image on the right is generated by:

In order to achieve the above effect cryptocode utilizes TIKZ underneath. The \pcnode command generates TIKZ nodes and additionally we wrapped the pseudocode (or procedure) command in an \begin{pcimage}\end{pcimage} environment which allows us to utilize these nodes later, for example using the \pcdraw command. We can achieve a similar effect without an additional pcimage environment by using the optional argument of \pcnode for the TIKZ code.

Example: Explain your Code

As an exmaple of what you can do with this, let us put an explanation to a line of the code.

```
\mathsf{KGen}(1^n) samples a public key \mathsf{pk} and a private key \mathsf{sk}.
```

```
begin { pcimage }
    \procedureblock [linenumbering] { $\indcpa_\enc^\adv(\secparam) $\} {\%}

b \sample \bin \\
    (\pk,\sk) \sample \kgen (\secparam)\pcnode {\kgen} \\
    (\mathrm{mode} \mathrm{mode} \m
```

4 Tabbing Mode

In the following section we discuss how to create multiple columns within a \pseudocode command. Within a \pseudocode command you can switch to a new column by inserting a \>. This is similar to using an align environment and placing a tabbing character (&). Also, similarly to using align you should ensure that the number of \> are identical on each line.

```
1 \pseudocodeblock{
2 \textbf{First} \> \textbf{Second} \> \textbf{Third} \> \textbf{Fourth} \\
3 b \sample \bin \> b \sample \bin \> b \sample \bin \\
```

As you can see the first column is left aligned the second right, the third left and so forth. In order to get only left aligned columns you could thus simply always skip a column by using $\$ You can also use $\$ a shorthand for $\$.

First Second Third Fourth
$$b \leftarrow \$ \{0,1\}b \leftarrow \$$$

Column Spacing You can control the space between columns using the option "colsep=2em". Note that when doing so you should additionally use "addtolength=5em" (where 5em depends on the number of columns) in order to avoid having overfull hboxes.

First	Second	Third	Fourth
$b \leftarrow \$ \left\{ 0,1 \right\}$			

This is basically all you need to know in order to go on to writing protocols with the cryptocode package. So unless you want to know a bit more about tabbing (switching columns) and learn some of the internals, feel free to proceed to Section 5.

4.1 Tabbing in Detail

At the heart of the pseudocode package is an align (or rather a flalign*) environment which allows you to use basic math notation. Usually an align (or flalign) environment uses & as tabbing characters. The pseudocode comes in two modes the first of which changes the default align behavior. That is, it automatically adds a tabbing character to the beginning and end of each line and changes the tabbing character to \>. This mode is called *mintabmode* and is active by default.

In mintabmode in order to make use of extra columns in the align environment (which we will use shortly in order to write protocols) you can use \> as you would use & normally. But, don't forget that there is an alignment tab already placed at the beginning and end of each line. So the following example

is generated by

```
1
2  \pseudocodeblock{
2  \textbf{Alice} \> \> \textbf{Bob} \\
3  b \sample \bin \> \\
4  \> \xrightarrow{\text{send over } b} \> \\
5  \> \text{do something}}
```

4.1.1 Overriding The Tabbing Character

If you don't like \> as the tabbing character you can choose a custom command by overwriting \pctabname. For example

```
Tolerand Transfer Tenewcommand Tenewco
```

4.1.2 Custom Line Spacing and Horizontal Rules

As explained, underlying the pseudocode command is an flalign environment. This would allow the use of \\[spacing]\] to specify the spacing between two lines or of [\\hline] to insert a horizontal rule. In order to achieve the same effect within the pseudocode command you can use \\[spacing][\hline]. You can also use \pclb to get a line break which does not insert the additional alignment characters.

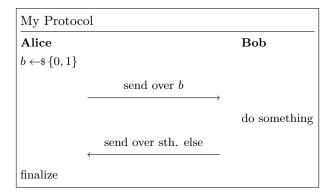

5 Protocols

Using tabbing, we can use \pseudocode to also layout protocols such as

which is generated as

In order to get nicer message arrows use the commands \sendmessageright*{message}, \sendmessageleft*{message}, and \sendmessagerightleft*{message}. All three take an additional optional argument specifying the length of the arrow and all wrap their mandatory argument in an aligned environment.

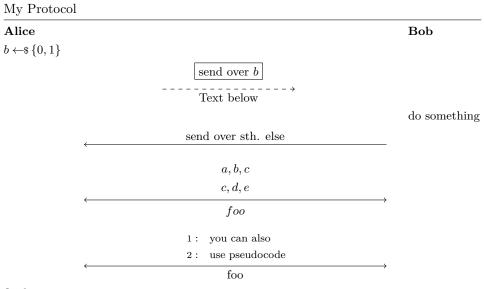

```
\sendmessageright * [3.5cm] { message }
\sendmessageleft * [3.5cm] { message }
```

```
1 \procedureblock{My Protocol}{%
2 \textbf{Alice} \> \textbf{Bob} \\
3 b \sample \bin \> \\
4 \> \sendmessageright*{\text{send over } b} \> \\
5 \> \text{do something} \\
6 \> \sendmessageleft*{\text{send over sth. else}} \> \\
7 \text{finalize} \> \> }
```

To obtain granular control over how messages are set use the \sendmessage and \sendmessage* commands. These take two parameters, the first being the message style for the underlying TIKZ path (e.g., -> for messages to the right) and the second a key

value list of arguments. The difference between the starred version and the unstarred version is that the starred version wraps its labels in an aligned environment. Following is an example, that showcases various message options.

finalize

sendmessage and sendmessage* support the following options:

top The content to display on top of the arrow.

bottom The content to display below the arrow.

left The content to display on the left of the arrow.

right The content to display on the right of the arrow.

topstyle The TIKZ style to be used for the top node.

bottomstyle The TIKZ style to be used for the bottom node.

rightstyle The TIKZ style to be used for the right node.

leftstyle The TIKZ style to be used for the left node.

length The length of the arrow.

style The style of the arrow.

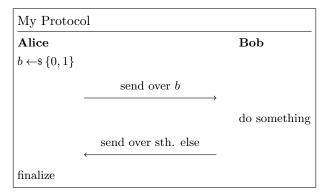

width The width of the column

centercol Can be used to ensure that the message is displayed in the center. This should be set to the column index. In the above example, the message column is the third column (note that there is a column left of alice that is automatically inserted).

5.1 Tabbing

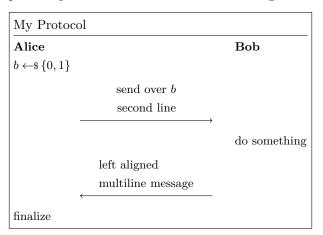

When typesetting protocols you might find that using two tabs instead of a single tab usually provides a better result as this ensures that all columns are left aligned. For this you can use $\$ instead of $\$ (see Section 4).

Following is once more the example from before but now with double tapping.

5.2 Multiline Messages

Using the starred send message commands you can easily generate multiline messages as the command wraps an *aligned* environment around the message.

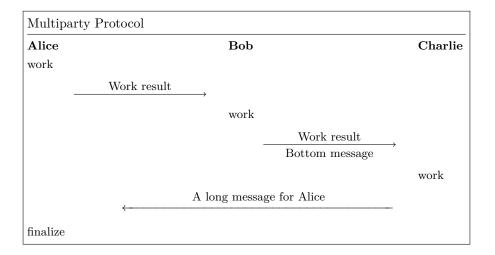

```
1  \procedureblock{My Protocol}{%
2  \textbf{Alice} \< \< \textbf{Bob} \\
3  b \sample \bin \< \\
4  \< \sendmessageright*{\text{send over } b\\ \text{second line}} \< \\
5  \< \< \text{do something} \\
6  \< \sendmessage*{<-}{top={\>\text{left aligned}\\ \> \text{multiline message}}} \\
7  \text{finalize} \< \<}</pre>
```

Remark. When using \sendmessage* the tabbing character & cannot be used. Instead use the \> command as defined within \pseudocode.

5.2.1 Multiplayer Protocols

You are not limited to two players. In order to send messages skipping players use \sendmessagerightx and \sendmessageleftx.

```
\sendmessagerightx[width]{columnspan}{Text}
\sendmessageleftx[width]{columnspan}{Text}
```

Note that for the last message from Charlie to Alice we needed to specify the number of passed over colums (\sendmessageleftx[7cm]{8}{message}). As we were passing 4 \< where each creates 2 columns, the total was 8 columns.

5.2.2 Divisions

You can use \pcintertext in order to divide protocols (or other pseudocode for that matter).

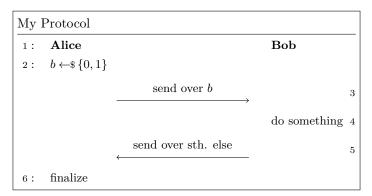

```
1 \pcintertext[dotted|center]{Division Text}
```

Note that in order to use the \pcintertext you need to use \pclb as the line break for the line before. Also see Section 4.

```
1  \procedureblock{My Protocol}{%
2  \textbf{Alice} \< \ \textbf{Bob} \\
3  b \sample \bin \< \pclb
4  \pcintertext[dotted]{Some Division} \\
5  \< \sendmessageright*{\text{send over } b} \< \\
6  \< \text{do something} \pclb
7  \pcintertext[dotted]{Another Division} \\
8  \< \sendmessageleft*{\text{message}} \< \\
9  \text{finalize} \< \< \\<</pre>
```

5.3 Line Numbering in Protocols

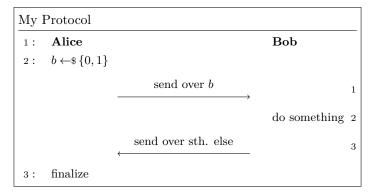

Protocols can be numbered similarly to plain pseudocode. Additionally to the \pcln there are the commands \pclnr and \pcrln. The first allows you to right align line numbers but uses the same counter as \pcln. The second uses a different counter.

Which is generated as

```
1  \procedureblock {My Protocol} {
2    \pcln \textbf{Alice} \< \< \textbf{Bob} \< \\
3    \pcln b \sample \bin \< \< \\
4    \< \sendmessageright*{\text{send over } b} \< \pclnr \\
5    \< \text{do something} \< \pclnr \\
6    \< \sendmessageleft*{\text{send over sth. else}} \<\ \pclnr \\
7    \pcln \text{finalize} \< \< \<<</pre>
```

And using \pcrln we obtain:

This is generated as

```
1 \procedureblock {My Protocol} {%
2  \pcln \textbf{Alice} \< \< \textbf{Bob} \\
3  \pcln b \sample \bin \< \\
4  \< \sendmessageright*{\text{send over } b} \< \pcrln \\
5  \< \< \text{do something} \pcrln \\
6  \< \sendmessageleft*{\text{send over sth. else}} \< \pcrln \\
7  \pcln \text{finalize} \< \< }</pre>
```

5.3.1 Separators

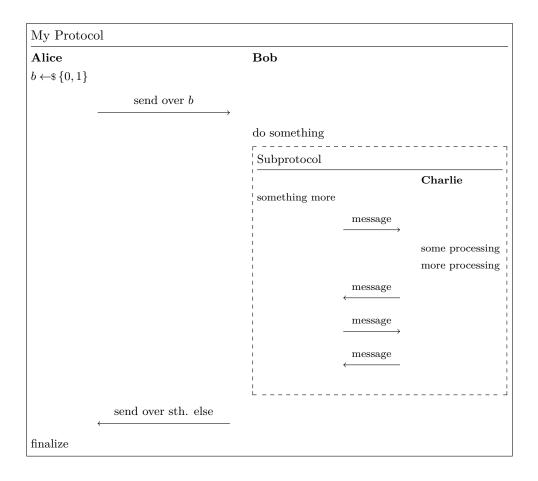

The commands \pclnseparator and \pcrlnseparator define the separators between code and line number. By default the left separator is set to (:) colon and the right separator is set to an empty string.

5.3.2 Spacing

Spacings after the left separator and in front of the right separator can be controlled by \pclnspace and \pclnrspace which are set to 1em and 0.5em, respectively.

5.4 Sub Protocols

Use the subprocedure environemnt to also create sub protocols.

```
| \procedureblock \textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\textbf\{\te
```

6 Game-Based Proofs

6.1 Basics

Besides displaying pseudocode the package also comes with commands to help presetn game-based proofs. The gameproof environment wraps the pseudocode block of a gamebased proof.

```
1 \begin{gameproof}
2 proof goes here
3 \end{gameproof}
```

Within a gameproof environment use the command \gameprocedure which works similarly to the pseudocode command and produces a heading of the form $\mathsf{Game}_{\mathsf{counter}}(n)$ where counter is a consecutive counter. Thus, we can create the following setup

$Game_1(n)$		$Game_2(n)$
1:	Step 1	Step 1
2:	Step 2	Step 2

by using

For discussing individual games, cryptocode provides the \pcgame command which without argument prints Game and with (optional) argument \pcgame[n] prints Game_n.

6.1.1 Highlight Changes

In order to highlight changes from one game to the next use \gamechange.

```
begin{gameproof}
begin{pchstack}[space=lem,center,boxed]

gameprocedure[linenumbering,mode=text]{%

Step 1 \
Step 2
}

gameprocedure[mode=text]{%

Step 1 \\
gameprocedure[mode=text]{%

Step 1 \\
end{pchstack}

end{pchstack}

lend{gameproof}
```

The background color can be controlled by redefining \gamechangecolor which by default is defined as

```
1 \definecolor{gamechangecolor}{gray}{0.90}
```

Remark. Note that \gamechange is always in text mode.

6.1.2 Boxed Games

Use \tbxgameprocedure in order to create two consecutive games where the second game is boxed. Use \pcbox to create boxed statements.

```
\begin { gameproof }
      regin{pchstack}[space=lem, boxed, center]
\gameprocedure[linenumbering]{
    \begin{pchstack}|
 4
5
         \text{text}\{\text{Step }1\}
         \text{Step 2}
 6
7
      \tbxgameprocedure{
  \text{Step 1}; \pcbox{\text{Alternative step 1}} \\
 9
         \gamechange {\text{Step 2 is different}}
10
11
      \gameprocedure{
         \text{Step 1}
12
13
         \text{\gamechange{Step 2}}
   \end{pchstack}
    \end{gameproof}
```

6.1.3 Reduction Hints

In a game based proof, in order to go from one game to the next we usually give a reduction, for example, we show that the difference between two games is bound by the security of some pseudorandom generator PRG. To give a hint within the pseudocode that the difference between two games is down to "something" you can use the \addgamehop command.

```
1 \addgamehop{startgame}{endgame}{options}
```

Here options allows you to specify the hint as well as the style. The following options are available

hint The hint text

nodestyle A TIKZ style to be used for the node.

pathstyle A TIKZ style to be used for the path.

edgestyle A TIKZ style to be used for the edge. This defaults to "bend left".

The edgestyle allows you to specify how the hint is displayed. If you, for example want a straight line, rather than the curved arrow simply use

If game proofs do not fit into a single picture you can specify start and end hints using the commands

```
\begin { gameproof }
   \begin { pchstack } [ center , space=2em]
     \gameprocedure[linenumbering]{
\text{Step 1} \\
\text{Step 2}
\frac{3}{4} 5
6
7
8
9
     \gameprocedure {
       \text{Step 1}
       \gamechange {\text{Step 2 is different}}
10
  \end{pchstack}
11
12
  13
15
  \end{gameproof}
```

6.1.4 Numbering and Names

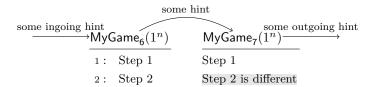

By default the gameproof environment starts to count from 1 onwards. Its optional parameters allow you to specify a custom name for the game as well as defining the starting number.

```
1 \begin{gameproof}[options]
```

The following parameters are available which, as usual, are provided in a key=value based form.

nr The starting number minus 1. Thus, when setting nr=5, the first game will be Game₆.name The name for the game

arg The argument to be used for the game.

```
begin { gameproof } [nr=5,name=\mathsf{MyGame}, arg=(1^n)]

begin { pchstack } [center, space=2em]

gameprocedure [linenumbering] {

text { Step 1} \\
 text { Step 2} }

gameprocedure {

text { Step 1} \\
 gamechange{\text{Step 1}} \\
 yamechange{\text{Step 2} is different}} }

end{pchstack}

addstartgamehop { hint=\footnotesize some ingoing hint, edgestyle=}

addgamehop { 6}{7}{ hint=\footnotesize some outgoing hint, edgestyle=}

addendgamehop { hint=\footnotesize some outgoing hint, edgestyle=}

end{gameproof}
```

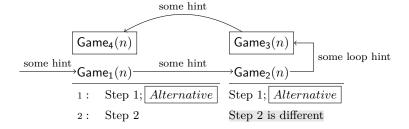

6.1.5 Default Name and Argument

The default name and argument are controlled via the commands \pcgamename and \gameprocedurearg.

Command	Default
\pcgamename	Game
\gameprocedurearg	\secpar

6.1.6 Bi-Directional Games

You can use the \bxgameprocedure to generate games for going in two directions. Use the \addloopgamehop to add the gamehop in the middle.

```
\begin{gameproof}
     \ bxgameprocedure \{4\} \{\%
3
              \text{Step 1}; \pcbox{Alternative} \\
      \pcln
4
5
              \text{Step 2}
      \ pcln
6
7
8
9
     \bxgameprocedure {3}{%
        \text{Step 1}; \pcbox{Alternative}
        \gamechange {\text{Step 2 is different}}
      \addstartgamehop{hint=\footnotesize some hint,edgestyle=}
10
    \addgamehop{1}{2}{hint=\footnotesize some hint,edgestyle=}
\addloopgamehop{hint=\footnotesize some loop hint}
11
12
      \addgamehop{2}{1}{hint=\footnotesize some hint}
13
    \end{gameproof}
```

6.1.7 Styling Game Procedures

It may come in handy to define default style arguments for the underlying pseudocode command used by \gameprocedure. For this you can define the default arguments by calling \setgameproceduredefaultstyle to for example:

```
\setgameproceduredefaultstyle{beginline=\vphantom{\bin^\prg_\prg}
```

The default is to not set any options.

6.2 Game Descriptions

reduction target

Cryptocode also comes with an environment to provide textual descriptions of games such as

MyGame₃(n): This is the third game. Lorem ipsum dolor sit amet, consectetur adipiscing elit. Duis condimentum velit et orci volutpat, sed ultrices lorem lobortis. Nam vehicula, justo eu varius interdum, felis mi consectetur dolor, ac posuere nulla lacus varius diam. Etiam dapibus blandit leo, et porttitor augue lacinia auctor.

 \downarrow MyGame₄(n): This is the fourt game. The arrow at the side indicates the reduction target.

The above example is generated as

```
\begin{gamedescription} [name=MyGame, nr=2] \describegame

This is the third game. Lorem ipsum dolor sit amet, consectetur adipiscing elit
Duis condimentum velit et orci volutpat, sed ultrices lorem lobortis. Nam vehicula, justo eu varius interdum, felis mi consectetur dolor, ac posuere nulla lacus varius diam. Etiam dapibus blandit leo, et porttitor augue lacinia auctor.

\describegame[inhint=reduction target]
This is the second game. The arrow at the side indicates the reduction target.
\end{gamedescription}
```

The gamedescription environment takes an optional argument to specify name and counter (defaults to Game and 0). The command \describegame starts a new game description and can allows you to provide a reduction hint using the option parameter inhint.

inhint Displays an ingoing arrow to denote the reduction target for this game hop.

length Allows to control the length of the arrow.

nodestyle Allows to control the style of the node.

hint Instead of having an ingoing arrow, this adds an outgoing arrow.

7 Black-Box Reductions

The cryptocode package comes with support for drawing basic black box reductions. A reduction always takes the following form.

```
begin {bbrenv}{A}

begin {bbrbox} [name=Box Name]

The Box's content

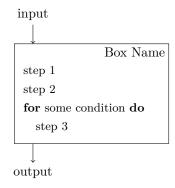

end {bbrbox}

Commands to display communication, input output etc

end {bbrenv}
```

That is, a bbrenv environment (where bbr is short for black-box reduction) which takes a single bbrbox environment plus some additional commands.

Following is a simple example with a single (black)box and some code plus inputs outputs:

This box is generated as

```
begin{bbrenv}[aboveskip=1cm, belowskip=1cm]{A}
begin{bbrbox}[name=Box Name]

pseudocode{
    text{step 1} \\
    text{step 2} \\
    pcfor \text{some condition} \pcdo \\
    t\text{step 3}

}
end{bbrbox}
bbrinput{input}
bbroutput{output}
cend{bbrenv}
```

The commands bbrinput and bbroutput allow to specify input and output for the latest bbrenv environment. The optional parameter for the bbrenv environment allows to specify leading and trailing space (this may become necessary when using inputs and outputs). For this provide aboveskip and belowskip keys. (Note that in an earlier version of cryptocode you could write \begin{bbrenv}[1cm]{A}[1cm]. While this format is still supported it should be regarded deprecated.)

The bbrenv environment takes the following options as optional first parameter:

aboveskip Space above.

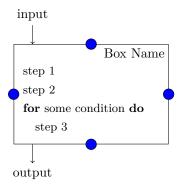

belowskip Space below.

tikzargs Underneath bbrenv is a tikzpicture and via tikzargs you can pass in arguments.

The single mandatory argument to the bbrenv environment needs to specify a unique identifier (unique for the current reduction). This id is used as an internal TIKZ node name (https://www.ctan.org/pkg/pgf).

```
1 \begin{bbrenv}[options]{UNIQUE IDENTIFIER}
2 % deprecated version
3 \begin{bbrenv}[vspace before]{UNIQUE IDENTIFIER}[vspace after]
```

As we are drawing a TIKZ image, note that we can easily later customize the image using the labels that we have specified on the way.

```
\begin { bbrenv } {A}
       \begin{bbrbox} [name=Box Name]
       \pseudocode{
         \text{step 1} \\
\text{step 2} \\
 4
5
         \pcfor \text{some condition} \pcdo \\
 6
7
8
          \pcind\text{step 3}
       \end{bbrbox}
      \bbrinput{input}
\bbroutput{output}
10
11
12
13
       \filldraw[fill=blue]
                                   (A.north) circle (4pt);
                                   (A. west) circle (4pt);
(A. east) circle (4pt);
       \filldraw [fill=blue
14
      \filldraw[fill=blue]
\filldraw[fill=blue]
15
                                   (A. south) circle (4pt);
16
     \end{bbrenv}
```

The bbrbox takes as single argument a comma separated list of key value pairs. In the example we used

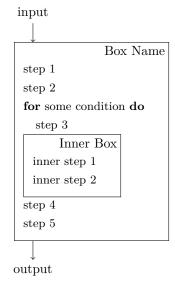

```
1 name=Box Name
```

to specify the label. The following options are available

Option	Description
name	Specifies the box's label
namepos	Specifies the position (left, center, right, top left, top center, top right, middle)
namestyle	Specifies the style of the name
abovesep	Space above box (defaults to \baselineskip)
$\min $	The minimal height
addheight	Additional height at the end of the box
xshift	Allows horizontal positioning
yshift	Allows horizontal positioning
style	allows to customize the node

7.1 Nesting of Boxes

Boxes can be nested. For this simply insert a bbrenv (together with a single bbrbox) environment into an existing bbrbox.

```
2
3
4
5
6
7
8
9
10
       \begin{bbrenv}{B}
\begin{bbrenv}{[name=Inner Box]}
\pseudocode{
  \text{inner step 1} \\
  \text{inner step 2}
11
12
13
14
15

7.2 Messages and Queries

You can send messages and queries to boxes. For this use the commands

```
1  \bbrmsgto{options}
2  \bbrmsgfrom{options}
3  \bbrmsgtofrom{options}{options}
4  \bbrmsgfromto{options}{options}
5  \bbrqryto{options}
6  \bbrqrytofrom{options}
7  \bbrqrytofrom{options}{options}
8  \bbrqryfromto{options}{options}
```

By convention messages are on the left of boxes and queries on the right. Commands ending on to make an arrow to the right while commands ending on from make an arrow to the left. The options define how the message is drawn and consists of a key-value list. The tofrom and fromto variants draw two messages (back and forth) that are more compactly set together. Here usually, the fist message should be drawn on top (top=Label) while the second message should be drawn on the bottom (bottom=Label).

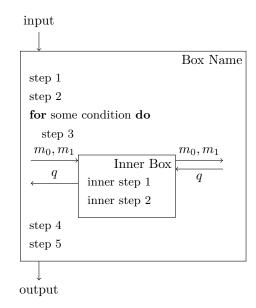

For example, to draw a message with a label on top and on the side use

```
1 \bbrmsgto{top=Top Label, side=Side Label}
```

If your label contains a "," (comma), then group the label in {} (curly brackets).

```
1 \bbrmsgto{top=Top Label, side={Side, Label}}
```

Following is a complete example. Notice that cryptocode takes care of the vertical positioning.

```
1  \begin{bbrenv}{A}
2  \begin{bbrbox}[name=Box Name]
3  \pseudocode{
```

```
\label{eq:local_text} $$ \text{text} \{ \text{step } 1 \} \ \text{text} \{ \text{step } 2 \} \ \text{pcfor } \text{text} \{ \text{some condition} \} \ \text{pcdo } \ \text{pcind} \text{text} \{ \text{step } 3 \}
 6
7
8
9
10
         \begin{bbrenv}{B}
             \begin{begin{bbrbox} | name=Inner Box]
11
12
             \pseudocode{
                \text{inner step 1} \\
\text{inner step 2}
13
\frac{14}{15}
16
17
             \end{bbrbox}
18
19

20
21
22
23
            \label{local_branch} $$\ \ \ \ \ {\rm top=\{\$m\_0,m\_1\$}\}$ {\bf bottom=\$q\$}$
         \end{bbrenv}
24
25
26
27
         \pseudocode{
             \text{step 4} \\
\text{step 5}
28
29
         \end{bbrbox}
30
          bbrinput {input}
31
         \bbroutput { output }
       \end{bbrenv}
```

7.2.1 Options

Following is a list of all available options. Remember that underneath the reduction commands is a TIKZ image (https://www.ctan.org/pkg/pgf/) and for each label position (top, side, bottom) a node is generated which can be further customized via low-level TIKZ.

top Label on top

bottom Label on the bottom

side Label on the far side of the box. For challengers and oracles, on the side of the box.

oside Label on the "other" side.

topstyle Style for label on top

bottomstyle Style for label on bottom

sidestyle Style for label on side

osidestyle Style for label on other side

edgestyle Style for edge

length Length of arrow

topname Name for node on top

bottomname Name for node on bottom

sidename Name for node on side

osidename Name for node on other side

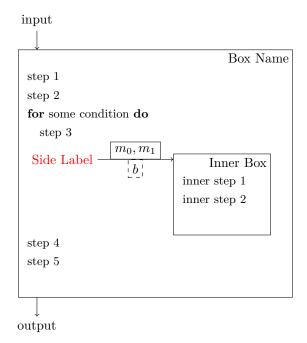

aboveskip Space before message

belowskip Space after message

fixedoffset Ignores automatic spacing and sets the message at the provided offset from the top.

fixedboffset Ignores automatic spacing and sets the message at the provided offset from the bottom.

islast Places the message at the bottom.

```
begin{bbrenv}{A}
\begin{bbrbox}[name=Box Name]
2
3
4
5
6
7
8
9
10
      \pseudocode{
         text(step 1) \\
\text{step 2} \\
\pcfor \text{some condition} \pcdo \\
\pcind\text{step 3}
      \begin{bbrenv}{B}
11
         \begin{begin{bbrbox} | [name=Inner Box]
12
         \pseudocode{
            \text{inner step 1} \\
\text{inner step 2} \\
13
14
15
16
         \end{bbrbox}
17
18
19
         topstyle = \{draw, solid\}, sidestyle = \{red\}, bottomstyle = \{draw, dashed\}\}
20
21
22
23
      \end{bbrenv}
      \pseudocode{
         \text{step 4} \\
\text{step 5} \\
24
25
26
27
       \end{bbrbox}
      \bbrinput { input }
```

```
29 \bbroutput{output}
30 \end{bbrenv}
```

First Message

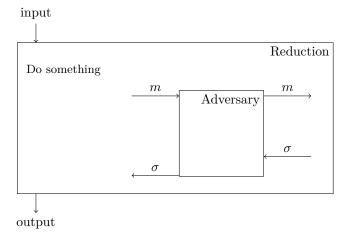

The first message is offset by $\begin{tabular}{l} \begin{tabular}{l} \begin{tabular}{l}$

7.2.2 Vdots

7.2.3 Add Space

If the spacing between messages is not sufficient you can use the bbrmsgspace and bbrqryspace commands to add additional space. Alternatively, you can use the options aboveskip and belowskip on the individual message or query commands.

```
begin {bbrenv} {A}

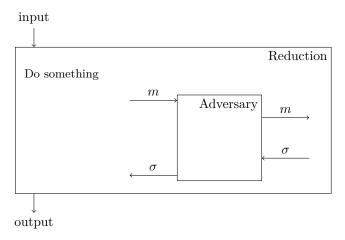

begin {bbrenv} {Iname=Reduction]}

pseudocode {
    \text{Do something}}

}
```

```
\begin {bbrenv} {B}
 8
              \begin{begin{bbrbox} [name=Adversary, minheight=15ex, xshift=4cm]
10
11
              \end{bbrbox}
12
13
             \bbrmsgto{top=\m^\}
\bbrmsgspace{1.5cm}
\bbrmsgfrom{top=\sigma\}}
14
15
16
17
18
             \bbrqryto{top=\m^\}
\bbrqryspace{1cm}
\bbrqryfrom{top=\sigma\}
19
20
21
22
23
24
         \ensuremath{\setminus} \operatorname{end} \{ \operatorname{bbrenv} \}
          \ensuremath{\mbox{end}}\{\ensuremath{\mbox{bbrbox}}\}
          \bbrinput {input}
25
          \bbroutput {output}
       \end{bbrenv}
```

Note that for placing a message at the bottom, islast or fixed offsets often allow obtain more accurate results.

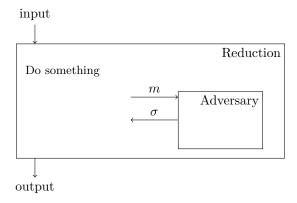

```
\begin {bbrenv}{A}
          \begin {bbrbox } [name=Reduction]

  \begin{array}{c}
    2 \\
    3 \\
    4 \\
    5 \\
    6 \\
    7 \\
    8 \\
    9
  \end{array}

          \pseudocode{
            \text{Do something}
         \begin{bbrenv}{B}
            \begin {bbrbox } [name=Adversary, minheight=15ex, xshift=4cm]
10
11
            \end{bbrbox}
12
13
             \bbrmsgto{top=$m$}
14
            \bbrmsgfrom \text{top=$\sigma$, islast}
15
16
             \brack bbrqryto {top=$m$, fixedoffset=4ex}
17
             \brune brqryfrom \{top=\$\sigma\$, fixedboffset=4ex\}
18
19
         \end{bbrenv}
20
21
          \end{bbrbox}
22
          \bbrinput{input}
23
          \bbroutput {output}
       \end{bbrenv}
```

7.2.4 Loops

Often an adversary may send poly many queries to an oracle, or a reduction sends many queries to an adversary. Consider the following setting

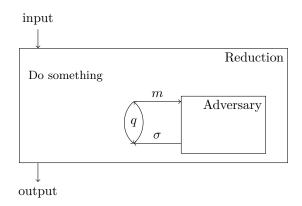

```
\begin {bbrenv}{A}
      begin {bbrbox } [name=Reduction]
     \pseudocode{
4 5 6 7 8 9 10 11
       \text{Do something}
     \begin {bbrenv}{B}
       \begin{bbrbox}[name=Adversary,minheight=10ex,xshift=4cm]
       \end{bbrbox}
12
13
14
15
16
17
       \bbrmsgto{top=$m$}
       \end{bbrenv}
     \end{bbrbox}
18
19
     \bbrinput {input}
20
     \bbroutput {output}
    \end{bbrenv}
```

First note that by specifying the minheight and xshift option we shifted the adversary box a bit to the right and enlarged its box. Further we specified custom names for the node on the side of the two messages. We can now use the bbrloop command to visualize that these two messages are exchanged q many times

```
1 \bbrloop{BeginLoop}{EndLoop}{center=$q$}
```

The bbrloop command takes two node names and a config which allows you to specify if the label is to be shown on the left, center or right. Here is the result.

```
\begin { bbrenv } {A}

    \begin{array}{r}
      2 \\
      3 \\
      4 \\
      5 \\
      6 \\
      7 \\
      8 \\
      9
    \end{array}

          \begin{begin{bbrbox} [name=Reduction]
          \pseudocode{
              \text{Do something}
          \begin{bbrenv}{B}
              \begin{begin{bbrbox} [name=Adversary, minheight=10ex, xshift=4cm]
10
11
              \end{bbrbox}
12
13
              \bbrmsgto{top=$m$, sidename=BeginLoop}
             \bbrmsgtoq \{0.5cm\} \bbrmsgfrom \{top=\$\sigma\$, \sidename=EeginLoop\} \bbrnsgfrom \{top=\$\sigma\$, \sidename=EndLoop\} \bbrloop \{BeginLoop\} \{EndLoop\} \{center=\$q\$\}
14
15
16
17
18
          \end{bbrenv}
19
20
          \end{bbrbox}
21
          \bbrinput { input }
\bbroutput { output }
22
        \end{bbrenv}
```

The \bbrloop command supports the following parameters:

center Label displayed within the loop

left Label displayed left of the loop

right Label displayed right of the loop

centerstyle Style for center label

leftstyle Style for left label

rightstyle Style for right label

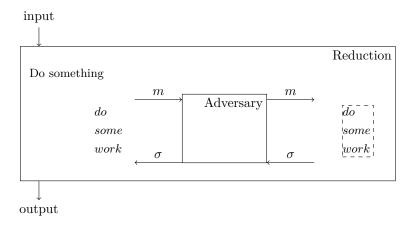

clockwise Loop going in clockwise direction

angle Angle of the arrows

7.2.5 Intertext

If your reduction needs to do some extra work between queries use the $\verb|\bbrmsgtxt|$ and $\verb|\bbrqrytxt|$ commands.

```
1 \bbrmsgtxt[options]{Text}
2 \bbrqrytxt[options]{Text}
```

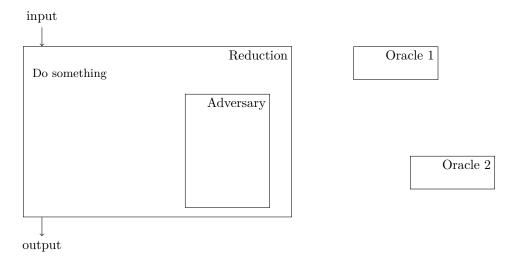

```
\begin {bbrenv} {A}
        \begin {bbrbox } [name=Reduction]

  \begin{array}{c}
    2 \\
    3 \\
    4 \\
    5 \\
    6 \\
    7 \\
    8 \\
    9
  \end{array}

       \pseudocode{
          \text{Do something}
       \begin {bbrenv}{B}
          \begin{begin{bbrbox} [name=Adversary, minheight=12ex, xshift=4cm]
10
11
          \end{bbrbox}
          \bbrmsgto{top=$m$}
13
14
          \bbrmsgtxt {\pseudocode {
             do \\
some
15
16
17
             work
18
19
          \bbrmsgfrom \text{top=$\sigma$}
20
21
          \bbrqryto{top=$m$}
22
          \bbrqrytxt[nodestyle={draw,dashed},xshift=2cm]{\pseudocode{
             do \\
some
23
24
25
             work
26
27
          \bbrqryfrom{top=$\sigma$}
28
29
       \end{bbrenv}
30
     \end{bbrbox}
\bbrinput{input}
\bbroutput{output}
\end{bbrenv}
31
32
33
```

7.3 Oracles

Each box can have one or more oracles which are drawn on the right hand side of the box. An oracle is created similarly to a bbrenv environment using the bbroracle environment. Oracles go behind the single bbrbox environment within an bbrenv environment.

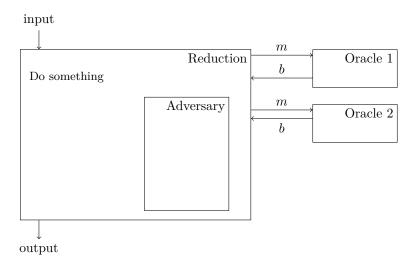

```
begin {bbrenv}{A}
      \begin { bbrbox } [name=Reduction ]
      \pseudocode{
4
5
        \text{Do something}
6
7
      \begin {bbrenv}{B}
        \begin{begin{bbrbox} [name=Adversary, minheight=3cm, xshift=4cm]
        \end{bbrbox}
10
11
      \end{bbrenv}
12
13
      \end{bbrbox}
14
      \bbrinput{input}
15
      \bbroutput { output }
16
17
      \begin { bbroracle } {OraA}
        \begin{bbrbox}[name=Oracle 1] \end{bbrbox}
18
19
      \end{bbroracle}
20
21
      \begin{bbroracle}{OraB}[vdistance=2cm,hdistance=3cm]
22
23
        \begin{bbrbox}[name=Oracle 2] \end{bbrbox}
24
25
      \end{bbroracle}
    \end{bbrenv}
```

Via the option "hdistance=length" and "vdistance=length" you can control the horizontal and vertical position of the oracle. By default this value is set to 1.5cm and \baselineskip.

7.3.1 Communicating with Oracles

As oracles use the *bbrbox* environment we can directly use the established ways to send messages and queries to oracles. In addition you can use the \bbroracleqryfrom and \bbroracleqryto.

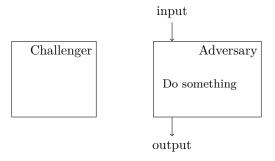

Here options allow you to specify where the label goes (top, bottom). In addition you can use \bbroracleqryspace to generate extra space between oracle messages. Note that oracle messages need to be added after the closing \end{bbroracle} command.

```
begin {bbrenv}{A}
         \begin { bbrbox } [name=Reduction ]
 \begin{array}{c} 3 \\ 4 \\ 5 \\ 6 \\ 7 \\ 8 \end{array}
        \pseudocode{
            \text{Do something}
        \begin{bbrenv}{B}
            \begin{begin{bbrbox} [name=Adversary, minheight=3cm, xshift=3cm]
10
11
        \end{bbrenv}
12
13
        \end{bbrbox}
        \bbrinput{input}
\bbroutput{output}
14
15
16
        \begin{bbroracle}{OraA} \begin{bbroracle}{Iname=Oracle 1, minheight=1cm} \end{bbrbox} \end{bbroracle}
17
18
19
20
        \bbroracleqrytotop=\m\}
\bbroracleqryfrom\{top=\s\}
21
22
23
        \begin{bbroracle}{OraB} \begin{bbroracle} {OraB} \cdot egin{bbrbox} [name=Oracle 2, minheight=1cm] \end{bbrbox}
24
25
26
27
        \end{bbroracle}
\bbroracleqrytofrom{top=\m$}{bottom=\b}}
28
      \end{bbrenv}
```

7.4 Challengers

Each box can have one or more challengers which are drawn on the left hand side of the box. Challengers behave identically to oracles with the exception that they are to the left of the box. A challenger is created similarly to a *bbrenv* environment using the *bbrchallenger* environment. Challengers go behind the single *bbrbox* environment within an *bbrenv* environment.

```
\begin {bbrenv} {A}
      \begin{begin{bbrbox} [name=Adversary, minheight=2cm]
      \pseudocode{
 4
5
        \text{Do something}
6
7
      \end{bbrbox}
      bbrinput {input}
      \bbroutput { output }
10
11
     \begin { bbrchallenger } { ChaA }
        \begin{bbrbox}[name=Challenger, minheight=2cm]
12
13
14
        \end{bbrbox}
15
     \end{bbrchallenger}
    \end{bbrenv}
```

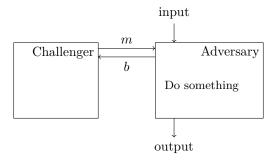

Via the option "hdistance=length" and "vdistance=length" you can control the horizontal and vertical position of the challenger. By default this value is set to 1.5cm and \baselineskip.

7.4.1 Communicating with Challengers

As challengers use the bbrbox environment we can directly use the established ways to send messages and queries to oracles. In addition you can use the \bbrchallengerqryfrom and \bbrchallengerqryto.

```
| \bbrchallengerqryfrom{options}
| \bbrchallengerqryto{options}
| \bbrchallengerqrytofrom{options}{options}
| \bbrchallengerqryfromto{options}{options}
```

Here options allow you to specify where the label goes (top, bottom). In addition you can use \bbrchallengerqryspace to generate extra space between oracle messages. Note that challenger messages need to be added after the closing \end{bbrchallenger} command.

```
1  \begin {bbrenv}{A}
2  \begin {bbrbox} [name=Adversary, minheight=2cm]
```

7.5 Horizontal Stacking

bbrenv environments can be stacked horizontally.

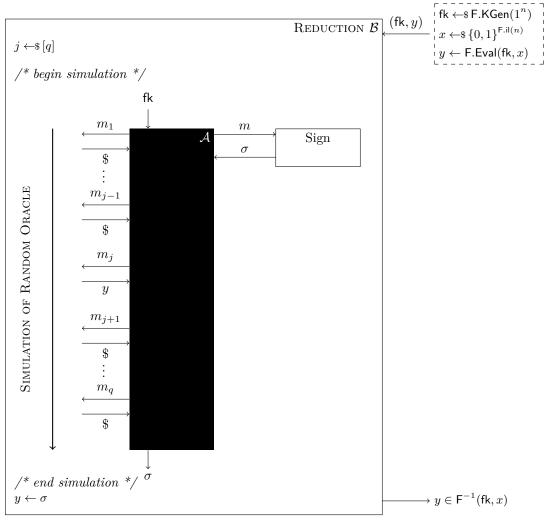

Note that in order to not have horizontal space inbetween the boxes, that you need to not leave any space. In the following code this is handled via comments.

```
\begin { figure } [h]
 2
3
       \centering
       \begin {bbrenv} {A}
 \frac{4}{5} \frac{6}{7} \frac{7}{8}
          \begin {bbrbox } [name=A, minheight=15mm]
          \pseudocode{a}
          \end{bbrbox}
          \bbrmsgfrom { islast=true, top={$a$}}
          \begin{cases} bbrqryto{aboveskip=6mm, top={$2a$}} \end{cases}
      \end{bbrenv}
    \begin {bbrenv}{B}
10
11
         \begin {bbrbox } [name=B, minheight=15mm]
12
          \end{bbrbox}
         \bbrqryto{edgestyle={<->}}
\bbrqryvdots[aboveskip=lmm]
14
         \bbrqryto { islast=true, edgestyle={<->}}
15
   \end{bbrenv}%
\begin{bbrenv}{C}
16
17
          \begin {bbrbox} [name=C, minheight=15mm]
18
          \end{bbrbox}
19
      \bbrqryto{top={$3a$}}
\end{bbrenv}%
20
    \end{figure}
```

7.6 Examples

A reduction sketch for full domain hash.

```
\begin{bbrenv}{Red}

8 Known Issues

8.1 Pseudocode KeepSpacing within Commands

with

The (experimental) "space=keep" option of pseudocode which should output spacing identical to that of the input will fail, if the pseudocode command is called from within another command. An example is to wrap the \pseudocode command in an \fbox or in a stacking environment such as \pchstack. As a workaround for generating frame boxes you should hence use a package such as mdframed (https://www.ctan.org/pkg/mdframed) which provides a frame environment.

```
Pseudocode with - spaces -

1 \quad \text{pseudocode [space=keep, mode=text]} \quad \text{Pseudocode} \quad \text{with} \quad - spaces -}
```

As an alternative you could use a *savebox* (in combination with the **lrbox** environment):

- spaces -

8.2 AMSFonts

Pseudocode

Some packages are not happy with the "amsfonts" package. Cryptocode will attempt to load amsfonts if it is loaded with either the "sets" or the "probability" option. In order to not load amsfonts you can additionally add the "noamsfonts" at the very end. Note that in this case you should ensure that the command \mathbb is defined as this is used by most of the commands in "sets" and some of the commands in "probability".

8.3 Hyperref

The hyperref package (https://www.ctan.org/pkg/hyperref) should be loaded before cryptocode. If this is not possible call the \pcfixhyperref after \begin{document}.

9 Implementation

Following is the implementation of cryptocode. The source code documentation is a work in progress.

```
1 (*cryptocode.sty)
```

Note that most macros are prefixed with pc short for pseudocode. This is a general design choice to not conflict with macros defined by other packages. One exception are the macros defined via the various package options.

Load amsmath and mathtools early on, before defining various macros.

```
2 \RequirePackage{amsmath}
3 \RequirePackage{mathtools}
```

9.1 Package Options

\@pc@opt@amsfonts Definitions of boolean flags used to determin whether or not to load amsfonts.

```
4 \newif\if@pc@opt@amsfonts
```

\@pc@opt@advantage Whether or not to define commands for the given option.

5 \newif\if@pc@opt@advantage

\@pc@opt@centernot Whether or not to load centernot

6 \newif\if@pc@opt@centernot

                 \pcindentname
                                                              612 \newcommand{\pctabname}{>}
                                                              613 \newcommand{\pcdbltabname}{<}
                                                              614 \newcommand{\pcindentname}{t}
                                                                      The following commands handle line numbering within the pseudocode command.
```

The pseudocode command itself does need to do some counter magic. We start with

```
hyperref happy
                                      615 \newcounter{pclinenumber}
                                      616 \newcounter{Hpclinenumber}
                                      617 \newcounter{Opclinenumber}
                                      618 \newcounter{H@pclinenumber}
                                      619 \newcounter{@pclinenumbertmp}
                                      620 \newcounter{pcgamecounter}
                                      621 \newcounter{Hpcgamecounter}
                                      622 \newcounter{pcrlinenumber}
                                      623 \newcounter{Hpcrlinenumber}
                                      624 \newcounter{@pcrlinenumbertmp}
                                           The following implements some counter magic. When using automatic linenumbering
                                     line numbers are nicely aligned before the first alignment tag. This, however confuses
                                     hyperref and we thus have a second counter that is updated after the first tag. This is
                                     done with the \OpclnOstephiddenlncnt

9.6.2 Automatic Syntax Highlighting and Spacing (Experimental)

Experimental LaTex3 string substitution helpers for automatic keyword highlighting. The regex parsing is (regrettably) super slow.

```

Change History

2310 (/cryptocode.sty)

v0.04	subscripts due to Tex treating
General: added $\protect\prot$	subscripts on composite objects
better control whitespace for \pcif,	with descenders differently than
\pcelse, \pcelseif 1	without 1
v0.05	v0.20
General: add bottom to namepos in	General: Added \pcfail. $\dots 1$
bbrbox	Added namepos middle for bbrbox 1
angle for bbrloop	Added valign to pseudocode to
	allow minipage vertical alignment 1
introduce hoffset for bbrinput 1 names for brrinput and bbroutput . 1 side and oside support to \bbroracleqryto and	Changed minheight for bbrbox environment to actually reflect a minimum height in tikz. The old minheight which added space at
$\begin{tabular}{lll} \textbf{bbroracleqryfrom} & \dots & 1 \end{array}$	the bottom was preserved as
v0.06	$addheight. \dots 1$
General: added $\protect\prot$	Ensure line numbers are right
v0.10	aligned to allow for two digit
General: Initial version 1	linenumbers having the same
v0.11	width
General: Added <i>pcmbox</i> environment	v0.30
for matrices in pseudocode 1 Added \NAND command 1 changed command pckeystyle to ensure that subscripts on sk and pk are aligned the same before,	General: replace obsolete l3regex 1 v0.31 General: added \prp
(sk_R,pk_R) had slightly misaligned	co for in-text) $\dots \dots 1$

v0.32	Added headheight option to
General: allow overwriting rule	\pseudocode 1
command in pseudocode via	Added minlineheight option to
headlinecmd (defaults to \hrule)	\pseudocode 1
allow to control spacing with \backslash pcfor 1	Added oracles package option 1
v0.40	Added space option to \pchstack
General: Adapted bbrenv environment	and \pevstack
to take key value option list. Old	. -
format is still supported but	Adjusted spacing via \pcaboveskip
deprecated	and \pcbelowskip which are added
Added \argmax and \argmin to	to \pseudocode blocks and
operators	pchstack environments
Added \pindist, \sindist, and	Bigger refactoring. Not completely
\cindist to operators. $\dots \dots 1$	backwards compatible. In
Added aboveskip and belowskip	particular, optimized spacing of
option to $\protect\p$	pseudocode blocks and black box
Added additional adversaries 1	reductions 1
Added additional complexity classes. 1	Fixed spacing issues with black box
Added additional polynomials 1	reduction messages. $\dots \dots 1$
Added block forms for pseudocode	Renamed horizontal spacing
and procedure commands	commands \beforepcskip and
(\pseudocodeblock and	\afterpcskip to \pcbeforeskip and
\procedureblock) 1	$\protect\pro$
Added boxed, inline, noindent	Switched to mathtools
options to \pchstack and	DeclarePairedDelimiter for paired
\pcvstack 1	operators. Each paired operator
Added clockwise, leftstyle,	comes in two forms, e.g, abs and
centerstyle, rightstyle for bbrloop.	tabs the latter to be used in
Adjusted placing of center 1	flowtext which does not scale the
Added command \pcsetargs to	outer delimiters 1
define default arguments for	v0.41
pseudocode blocks 1	\bbrqryvdots: Added bbrqryvdots. 112
Added command \pcsethstackargs	bbrenv: Added tikzargs key to pass in
and \posetvstackargs to define	arguments to surrounding
default arguments for hstack and	tikzpicture
vstack environments	
Added fixedoffset, fixedboffset, islast for reduction messages.	Fixed horizontal spacing behind bbreny blocks
TOT TECHTCLION MESSAGES	DDICHV DIOCKS 104
